Policy-science interface: Building a community

Interpretation of Cloud-Climate Feedback as Produced by 14 Atmospheric General Circulation Models

R. D. CESS, G. L. POTTER, J. P. BLANCHET, G. J. BOER, S. J. GHAN, J. T. KIEHL, H. LE TREUT, Z.-X. LI, X.-Z. LIANG, J. F. B. MITCHELL, J.-J. MORCRETTE, D. A. RANDALL, M. R. RICHES, E. ROECKNER, U. SCHLESE, A. SLINGO, K. E. TAYLOR, W. M. WASHINGTON, R. T. WETHERALD, I. YAGAI

Cess et al., 1989

TABLE 2. LIST OF CMIP1 and CMIP2 subprojects with main points of contact.

CMIP1 subprojects	CMIP2 subprojects
1) Analysis of variance in the CMIP coupled models Tim Barnett UCSD/Scripps Institution of Oceanography, La Jolla, CA	1) East Asia climate change Wei-Chyung Wang University at Albany, State University of New York, Albany, NY
2) North Atlantic oscillation (NAO) variability (NAOMIP) David Stephenson University Paul Sabatier, Laboratoire de Statistique, Toulouse, France	2) Signal detection in the CMIP2 model integrations Tim Barnett UCSD/Scripps Institution of Oceanography, La Jolla, CA
3) Documentation of interannual variability and coupled processes Marc Pontaud Direction InterRegionale de Météo-France en Polynésie Française, Tahiti, French Polynesia	3) Dynamic response of the ocean to global warming Scott Power Bureau of Meteorology Research Centre, Melbourne, Australia
4) Simulation of the cryosphere in coupled models Gregory M. Flato Canadian Centre for Climate Modelling and Analysis, Victoria, BC, Canada	4) Climate change in northern Europe Jouni Räisänen Rosby Centre, Norrköping, Sweden
5) Potential predictability of the coupled system at long timescales George J. Boer and Francis Zwiers Canadian Centre for Climate Modelling and Analysis, Victoria, BC, Canada	5) Energetics of coupled models: Role of oceanic heat transport on climate and climate change Emmanuelle Cohen-Solal and Jean-Louis Dufresne LMD, Paris, France
6) Autocorrelation analysis of the hemisphere O/AGCM control-run temperature data Tom Wigley National Center for Atmospheric Research, Boulder, CO Richard Smith and Ben Santer Lawrence Livermore National Laboratory, Livermore, CA	6) The correlation between oceanic structure, ocean circulation, and heat transport in coupled models Yanli Jia and David Webb Southampton Oceanography Centre, Southampton, United Kingdom
7) East Asia climate Wei-Chyung Wang University at Albany, State University of New York, Albany, NY	7) Biospheric carbon cycle response to global warming Pierre Friedlingstein LSCE, Paris, France
8) Southern mid-to-high-latitude variability Wenju Cai CSIRO, Aspendale, Australia	8) Effective climate sensitivity Sarah Raper Climatic Research Unit, UEA, East Anglia, United Kingdom
9) Analysis of coupled model variance David Ritson Stanford University, Palo Alto, CA	9) Ocean thermal expansion and heat uptake in climate change experiments Jonathan Gregory Hadley Centre, Bracknell, United Kingdom
10) Effect of flux adjustments on interannual and decadal variability in the CMIP ocean-atmosphere climate models P. B. Duffy and Curt Covey Lawrence Livermore National Laboratory, Livermore, CA Jason Bell University of California, Santa Cruz, Santa Cruz, CA	10) Vertical structure of warming in CO ₂ climate change experiments S. Fred Singer SEPP, Fairfax, VA
	11) Analysis of climate variability and change using simple global indices David Karoly CRC for Southern Hemisphere Meteorology, Clayton, Australia

Policy-science interface: Building a community

Eyring et al., 2016

Tim Palmer (19.3.2014): "Based on data just received"

IPCC WG1: Is the trend real?

Early indications suggest a trend

Subsequent hiatus causes doubt

Further data confirms trend – and it's all human induced

Future projections indicate dangerous levels could be reached

Optimal Fingerprints for the Detection of Time-dependent Climate Change

K. HASSELMANN

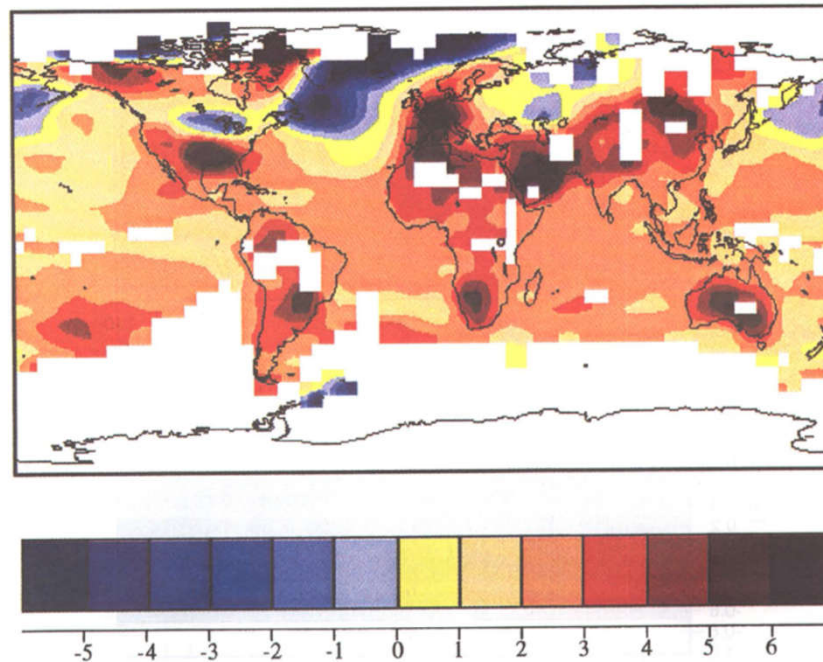

Max-Planck-Institut für Meteorologie, Hamburg, Germany

(Manuscript received 24 August 1992, in final form 17 March 1993)

Detecting Greenhouse-Gas-Induced Climate Change with an Optimal Fingerprint Method

GABRIELE C. HEGERL,* HANS VON STORCH,* KLAUS HASSELMANN,*
BENJAMIN D. SANTER,+ ULRICH CUBASCH,& AND PHILIP D. JONES®

Hegerl et al., 1996

Curiosity-driven science becomes policy-relevant (example 2)

The balance of evidence suggests a discernible human influence on global climate.

There is new and stronger evidence that most of the warming observed over the last 50 years is attributable to human activities.

Most of the observed increase in global average temperatures since the mid-20th century is *very likely* due to the observed increase in anthropogenic greenhouse gas concentrations.

It is *extremely likely* that human influence has been the dominant cause of the observed warming since the mid-20th century.

Curiosity-driven science becomes policy-relevant (**example 2**)

The balance of evidence suggests a discernible human influence on global climate.

There is new and stronger evidence that most of the warming observed over the last 50 years is attributable to human activities.

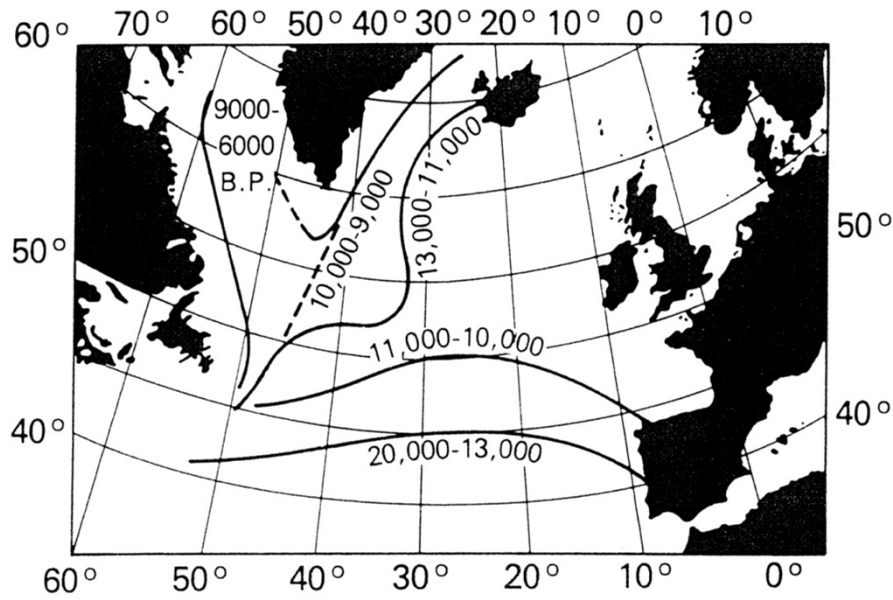

Most of the observed increase in global average temperatures since the mid-20th century is *very likely* due to the observed increase in anthropogenic greenhouse gas concentrations.

Human influence on the climate system is clear.

INTERGOVERNMENTAL PANEL ON **climate change**

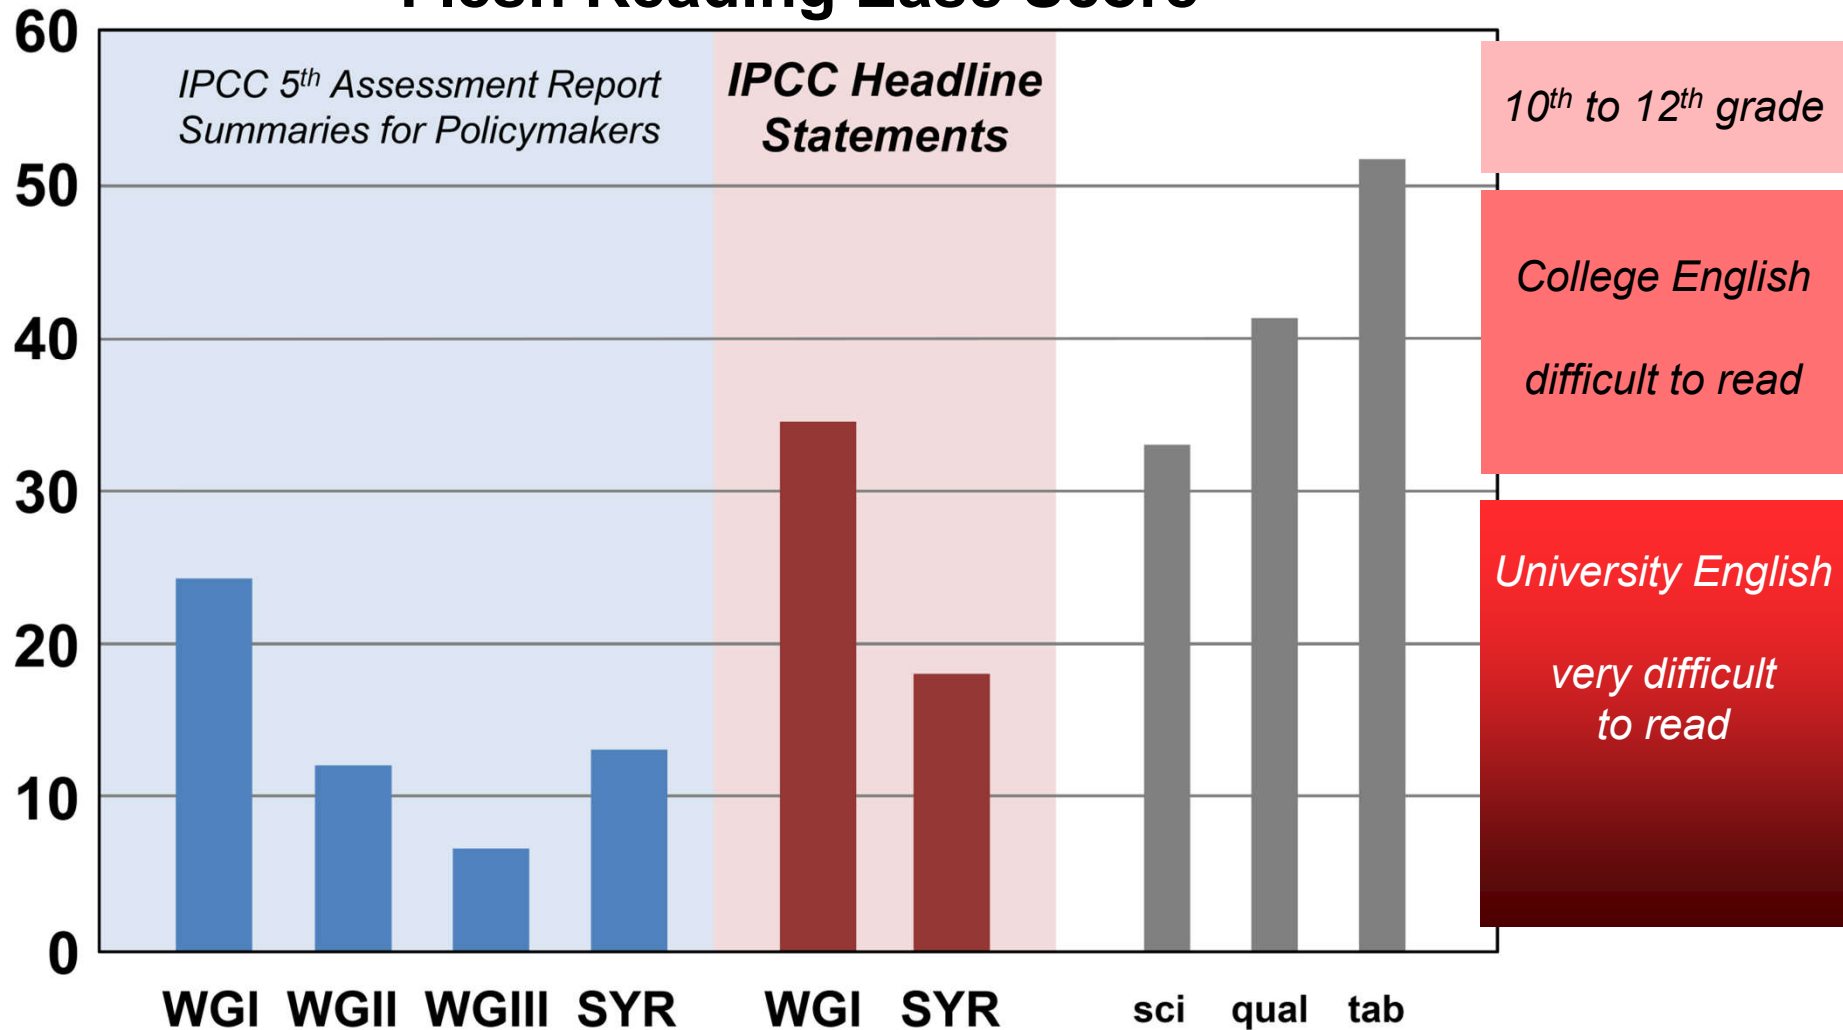

CHECK AGAINST DELIVERY

Statement by Hoesung Lee at IPCC Side Event on Communications Paris, Monday 30 November 2015

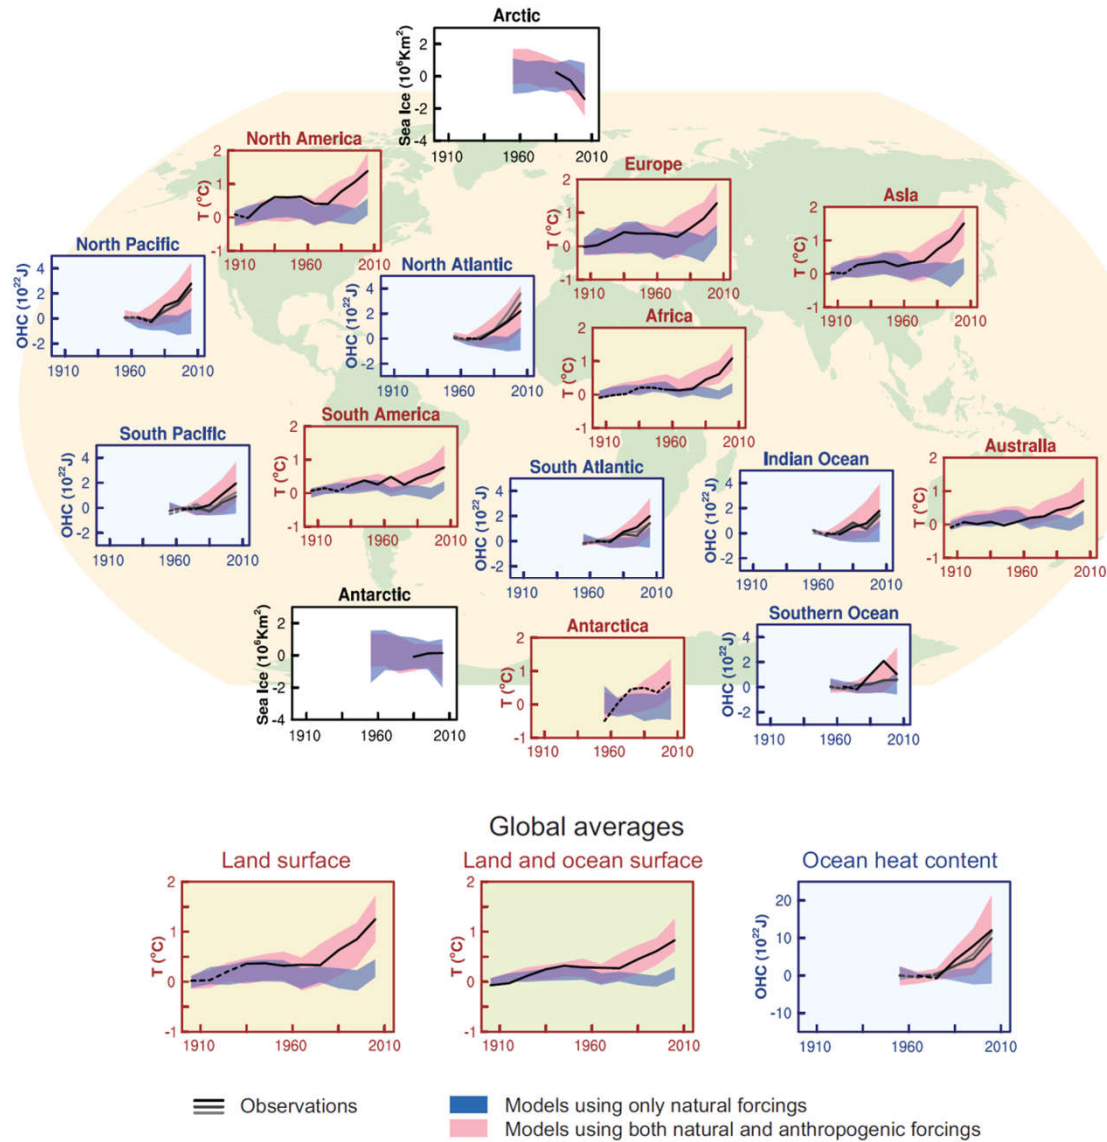

that will help deliver those solutions. For example, how can we ensure that these diverse needs and requirements feed into our scoping process? The scoping process, for those who don't know, determines the shape and outline of the new report.

You may have seen the recent Nature Climate Change study that found that an IPCC Summary for Policymakers is harder to understand than a paper by Einstein. We want to examine how to make our products more readable, ourselves or working with third parties, but more than that we want to ensure that our products are more relevant. And it goes without saying that we must secure the scientific rigour on which that gold standard I mentioned is based. But communications is not just about simple writing and better graphics – although those are important. It is also about facilitating solutions.

CLIMATE
CHANGE
SCIENCE
2013:
HAIKU

Gregory
C.
Johnson

HISTORY, EARTH: / Big, fast carbon surge: / Ice melts, oceans heat and rise. / Air warms by decades.

CHANGE DRIVERS: / CO₂, methane/ warm despite sun-spots, dust, soot, / clouds, and volcanoes.

MODELS: / Models of climate / improve with time and details . . . / capture big patterns.

RESPONSE: / We burn more carbon / air warms for decades – but seas . . . / for millennia.

Concluding thoughts:

- ❖ Curiosity-driven science may become policy-relevant. **Be prepared for it.**
- ❖ Policy questions may be inspiring, but they usually limit the free-thinking spirit of science. **Engage for bottom-up science.**
- ❖ Communication of scientific findings remains a challenge, in particular figures. **Try out new avenues.**
- ❖ Interesting science topics may break loose. **Participate in deep discussions on values, ethics, justice, and governance.**
