2: RNCAN, Geological Survey of Canada (GSC), Québec, Canada

3: Université de Lausanne (UNIL), Lausanne, Suisse

4: Université Laval, Québec, Canada

Objective

- Develop an **integrated** aquifer characterization approach at a **few km² scale** appropriate to understand and manage a **contaminated site**:
 - Has to define aquifer **heterogeneity** & inform on contaminant migration paths and fate
 - Has to produce data that can **constrain** conceptual and numerical **aquifer models**
- Develop a **practical** approach with **proven field methods** through the study of a **real field site** with an environmental issue (**landfill leachate**)

Field Characterization Approach

General Characterization Approach

- Characterize at a **sub-regional scale** covering source zones and receptors (**5-20 km²**)
- Acquire a **broad range of data** (geological, hydraulic, geophysical & geochemical)
- Emphasize high-resolution and continuous 1D or 2D **indirect geophysical data**
- Use direct-push **fully-screened wells** to acquire **high-resolution hydraulic data colocated** with indirect geophysical data

From Broad to Detailed Methods

Approach analog to petroleum exploration

(See Bradford & Babcock, *TLE*, July 2013)

INDIRECT METHODS

Regional surficial geology
(depositional environment)

GPR & ERT surveys
(structure & materials)

CPT/SMR soundings
(S , T , D , R)

Direct-push
wells

Soil samples

DIRECT METHODS

Multilevel
slug tests (K_h)

Permeameter
(K_v)

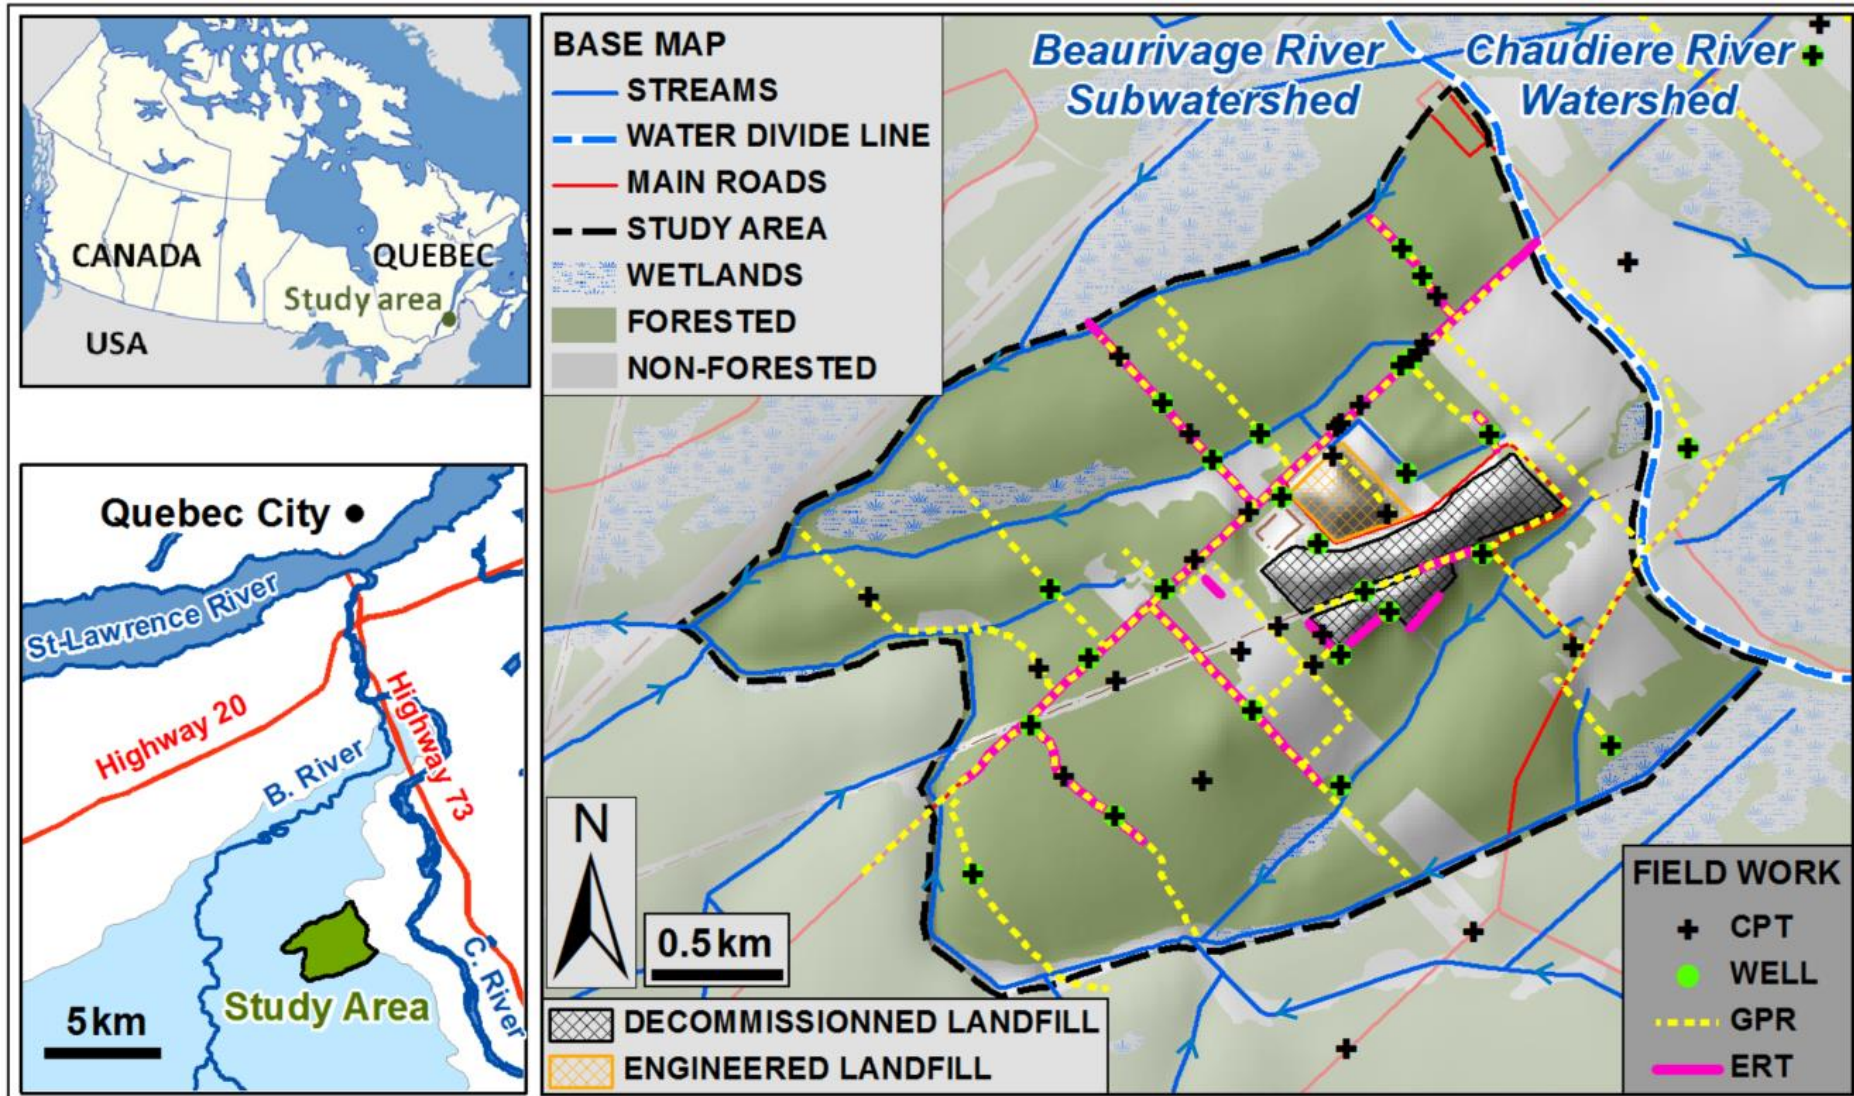

Analyses
(n , grain size)

Resolution (+)
Spatial Coverage (+)

The St-Lambert 12 km² Study Area

Measurements of Hydraulic Conductivity K

Adapted Direct K Measurements

- **Role:** provide detailed K control
 - Establish relationships with indirect data
- **Need:** high-resolution and complete
 - Continuous horizontal and vertical K (K_h & K_v)
- **Methods:** fully-screened direct-push wells
 - No filter pack to avoid short-circuits
 - Continuous & colocated K (w/ CPT/SMR, ERT)
 - Multi-level slug tests provide high-resolution K
 - Flowmeter K_h profiles to decrease testing time
 - New vertical interference tests to obtain K_v

realizations

Perspective

Perspective

- **Data:** integrated hydrogeophysical characterization with multiple measurements
 - Efficient “general-to-details” approach
 - Regional geophysical data & high-resolution **colocated** geophysical and direct K data
- **Processing:** need robust **integration** methods
- **Verification / history matching:** “hydraulically plausible” or “optimal” heterogeneity models from large sets provided by geostatistical realizations (**hydraulic data & tracers**)
