

# **Safecast: How disaster led to empowerment of crowdsourced citizen science for radiation measurement and communication after Fukushima**

Azby Brown: Safecast; Kanazawa Institute of Technology  
Future Design Institute

EGU General Assembly, Vienna, April 2016

**14:46:24 JST - March 11, 2011**

**Greater Eastern Japan Earthquake and Tsunami  
Fukushima Nuclear Powerplant Accident**

# From the point of view of average citizens:

- Fear, need to decide soon whether to flee
- Information vacuum
- Official sources deemed untrustworthy
- Social media paints more dire picture
- Even knowledgeable people can't find enough reliable and useful data

# Our Response:

- Develop devices
- Make a mapping system
- Build a community of motivated citizen-scientists who want to measure radiation.

Our first systems were bulky, but worked.

# Deployment:

Automobile

Bicycle

Hand-carry

Aerial drone

# Current workhorse:

## **bGeigie Nano**

- 7th-generation mobile detector
- Rugged
- Arduino-based
- GPS and data-logging
- LND 7317 2" pancake sensor
- OLED display
- Bluetooth and WiFi capable
- Open-source, open hardware, open data
- Designed to be sold as a kit, anyone can build it and upload data

~500 Devices worldwide

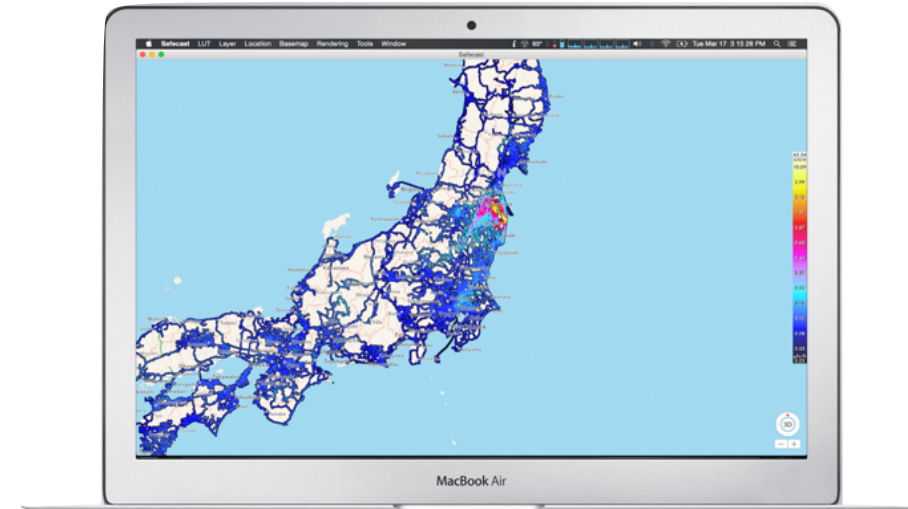

# iOS

# OS X

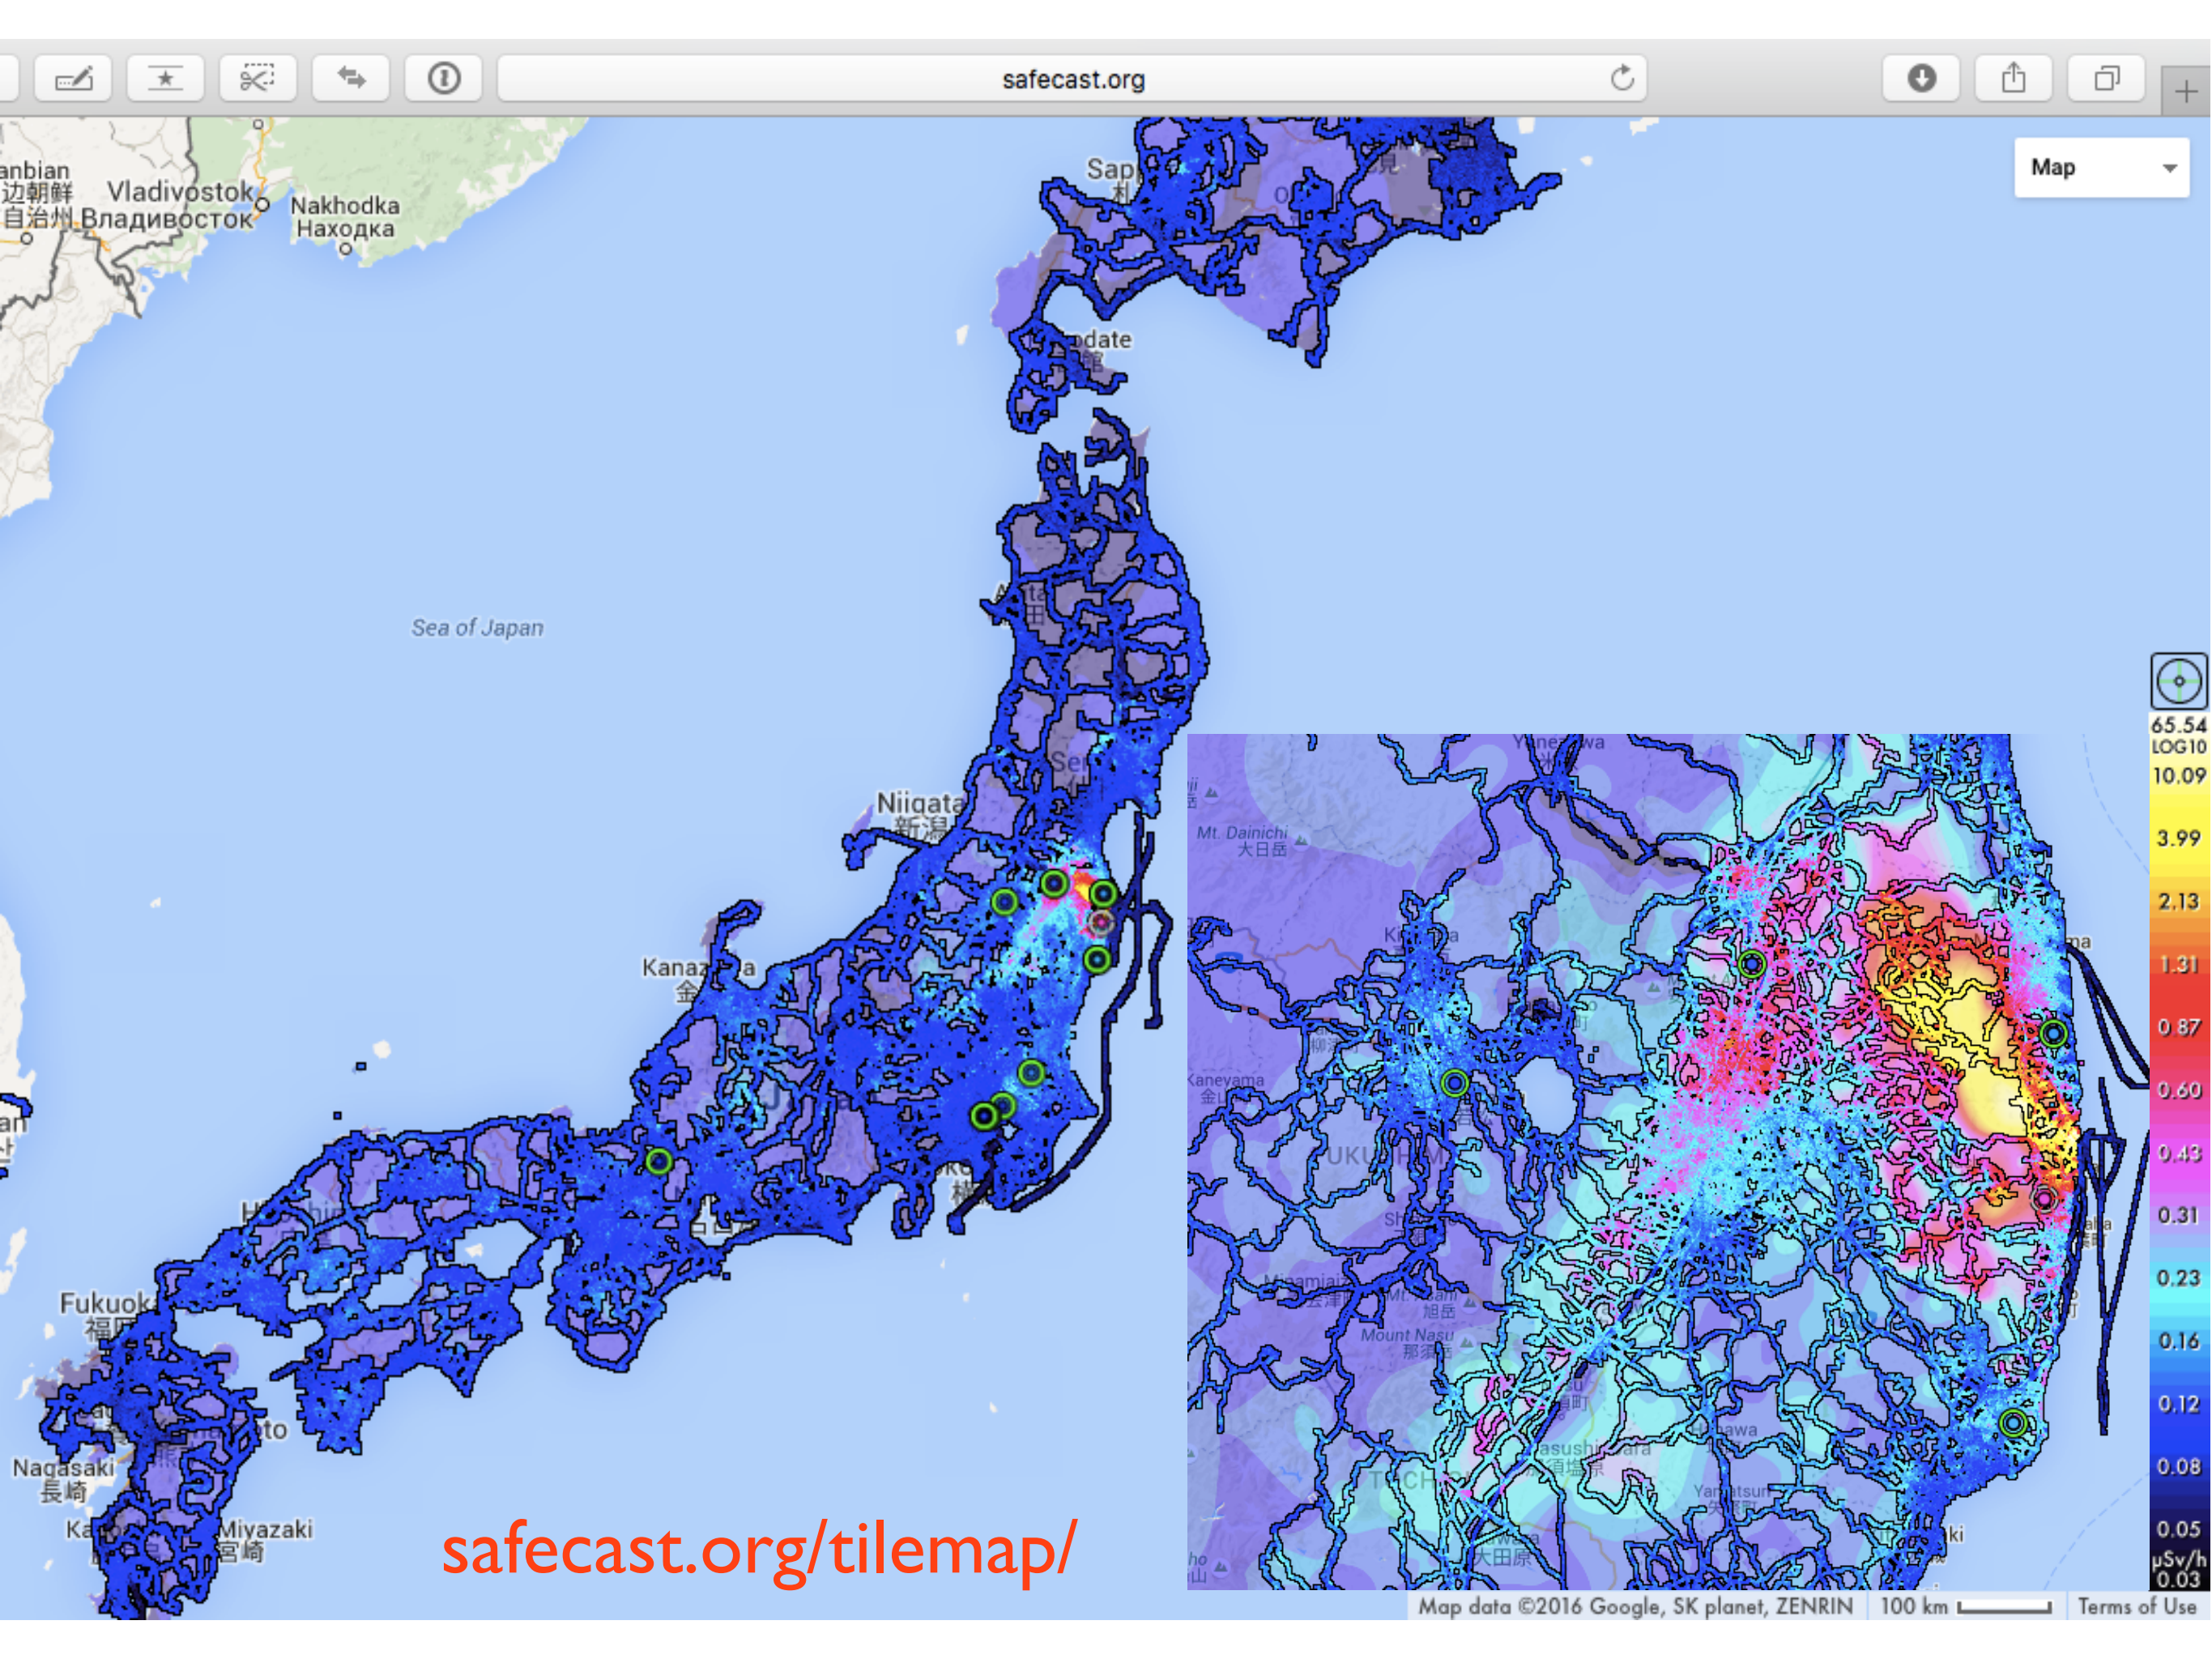

# Web

# Map system:

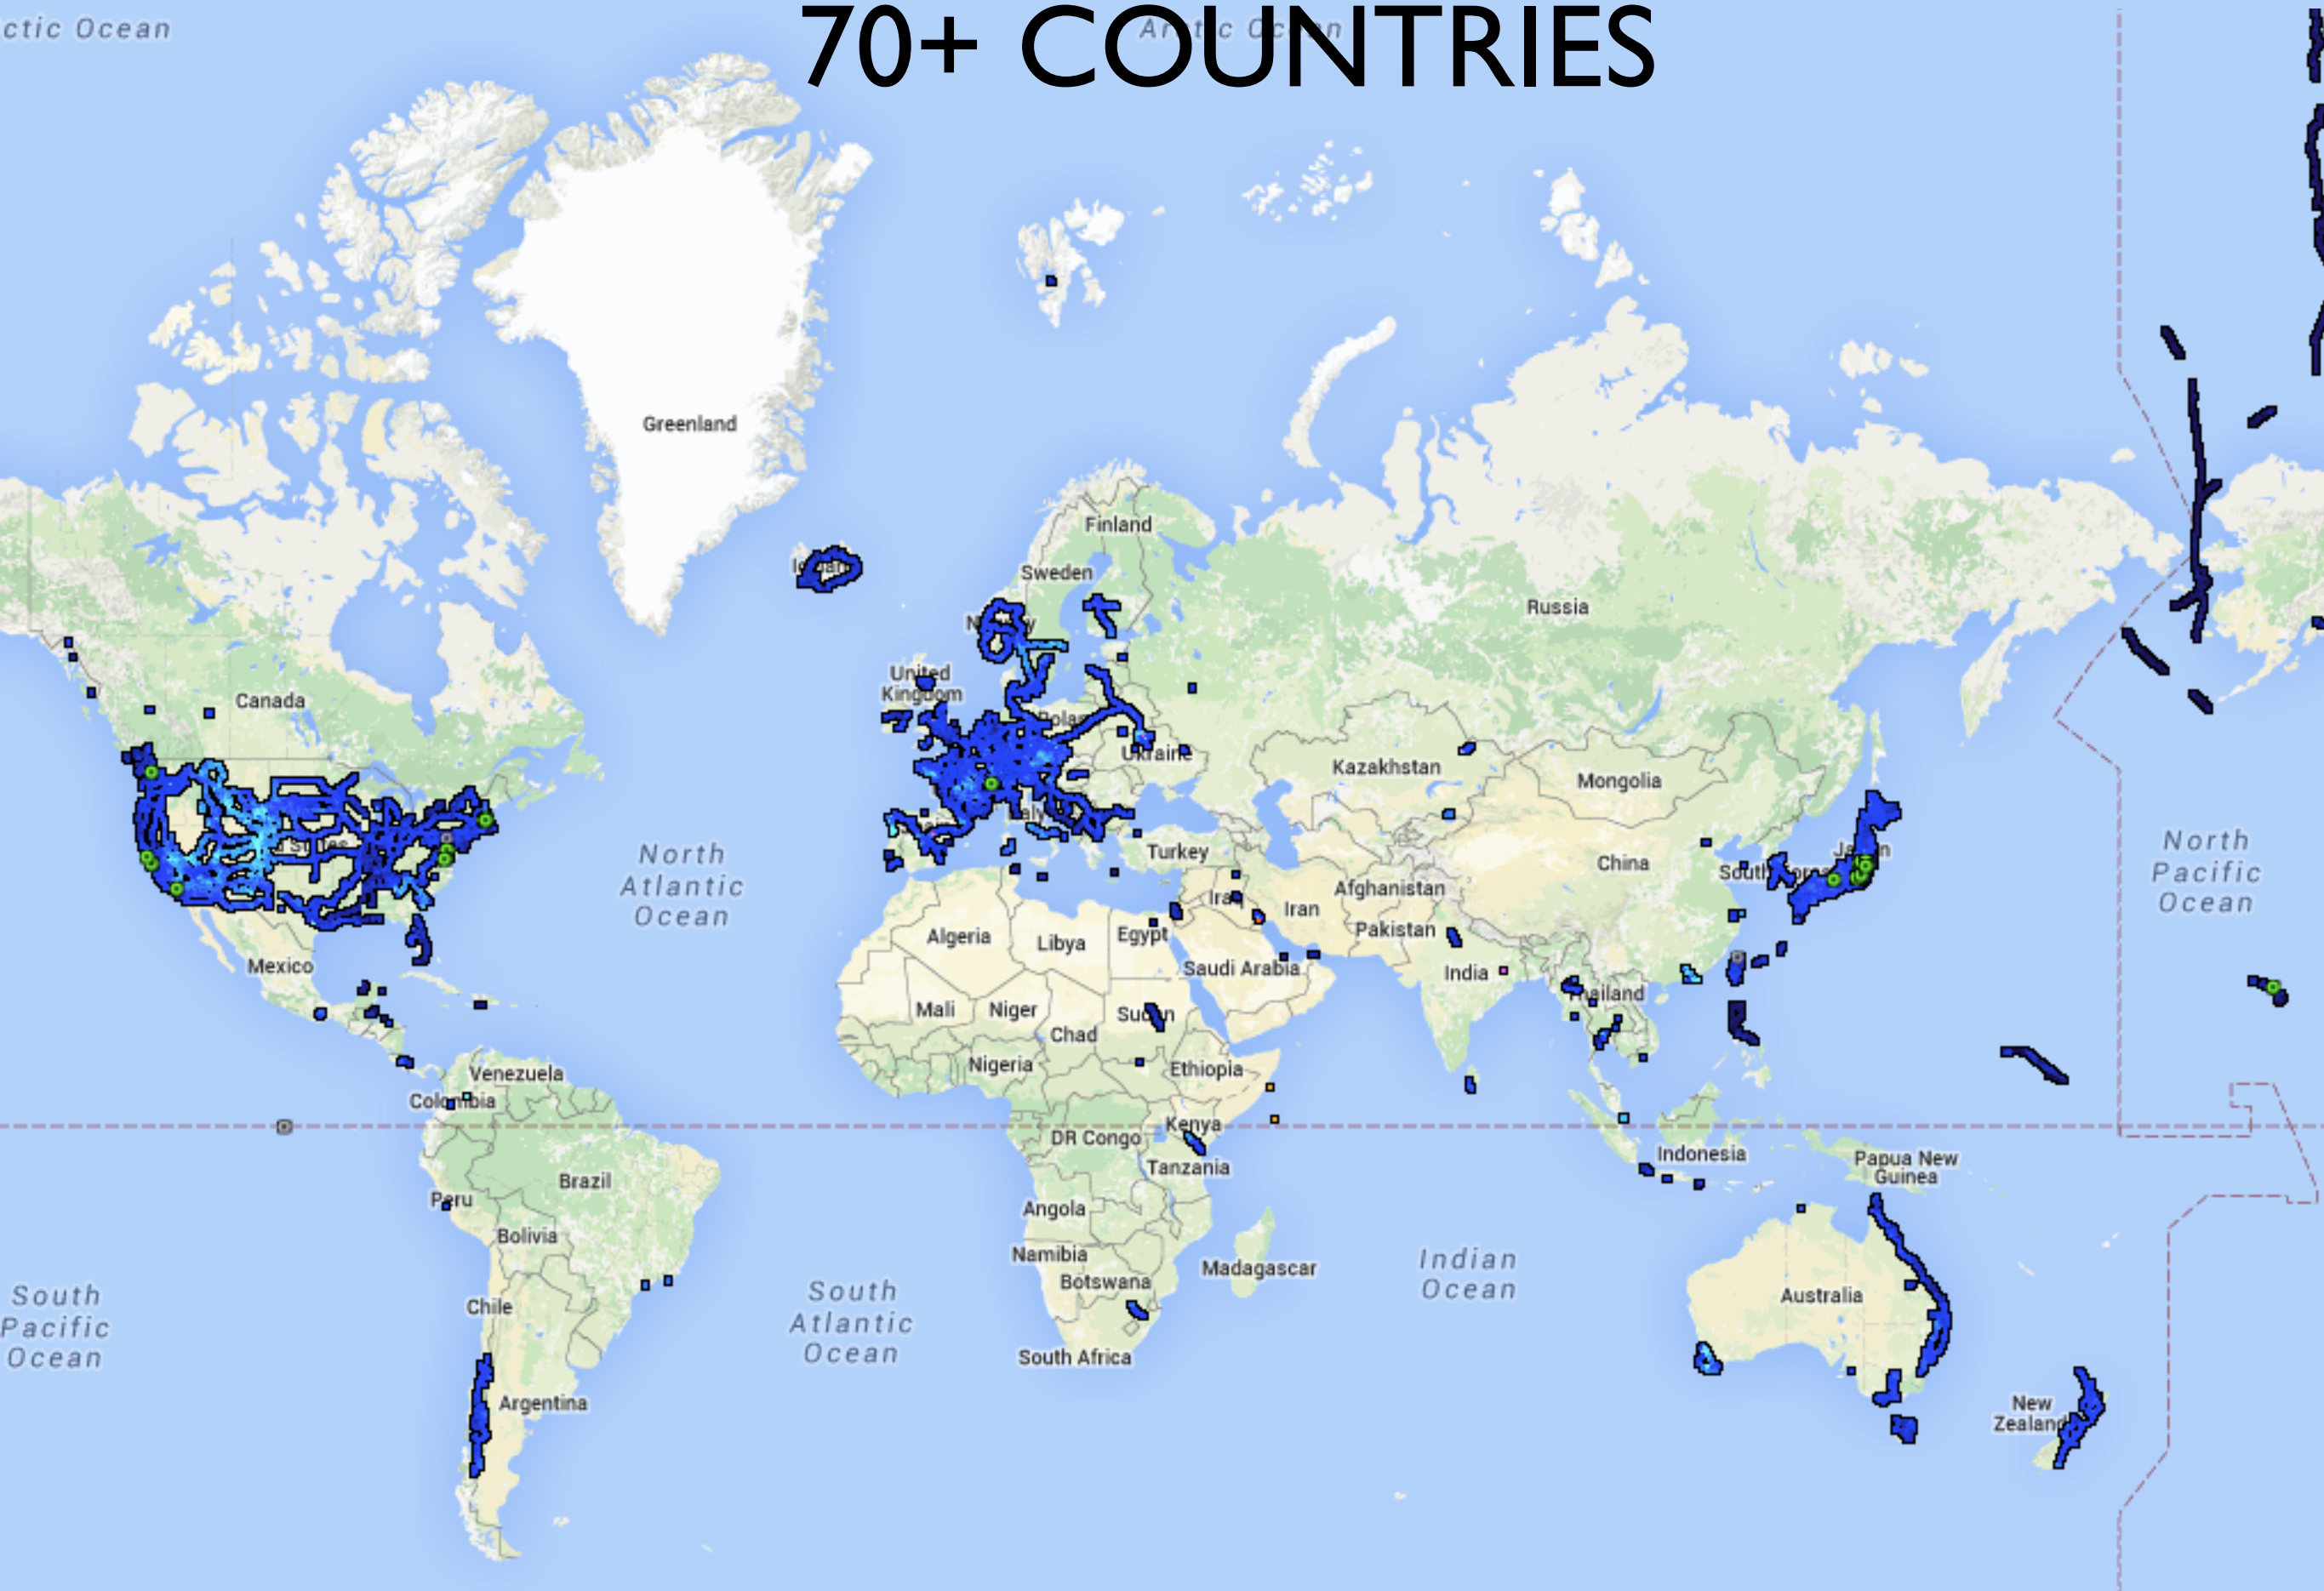

- Database updated daily, now approx 10GB
- Both server-fed webmaps and smart-client iOS and OSX apps
- API with query/filtering by time, location, device, etc.
- Approx 360 volunteers have uploaded data.  
But 90% is contributed by the most active 10%.
- Data and system are open-source (Creative Commons CC0 license). Anyone can download the data, and we encourage independent efforts based on our dataset.

Community

# Our Teams

*Lots of multitasking, multi-competence*

# Building Community

We want to encourage people to get involved.  
This requires skills in education and media.

- Strong social-media presence —  
blog, discussion, Facebook, Twitter, etc
- Device-building workshops
- Talks and presentations
- Media interviews

Hong Kong

Geiger-counter building workshop with students in Koriyama  
(They then become volunteers, contribute radiation readings,  
and teach others)

# CITIZEN SCIENCE:

- Where does the Safecast project lie within the spectrum of citizen science?
- ‘Crowd science’, ‘networked science’, ‘massively collaborative science’ ?
- Defined differently in different contexts
- Qualitative definitions and evaluative principles?
- Objective criteria for what constitutes ‘success’ ?

**‘With appropriate protocols,  
training, and oversight, volunteers  
can collect data of quality equal to  
those collected by experts’**

**(Bonney, 2014)**

# CROWDSOURCING:

- Meaning of crowdsourcing has evolved
- Safecast's primary goal is to assemble database of observations
- Based on open-source hardware and software
- The achievement of specific social outcomes, such as promotion of openness, is a major motivation from the start
- Ad-hoc voluntary structure which embodies the emerging open collaborative culture

# INFORMATION COMMONS:

- Decisions often reached through informal discussion
- Fluid decision making procedures
- Data-organization choices often impromptu, driven by affordances of open digital platforms
- Informal or semiformal hierarchies of authority, vs professional accreditation
- Norms that facilitate trust

# OPENNESS and TRANSPARENCY:

- Have been key components of the Safecast project from the start.
- Use of open-source hardware and software is considered essential.
- All designs are publicly available for scrutiny.
- Any outside observer can independently evaluate the group's tools and methodology.
- Open-data publication principles go hand-in-hand with this approach.

# WHAT IS SUCCESS?

- Key Metrics: Database size, how many users, how many detectors, etc..
- Intangibles: Perceived shifts in attitudes in society, a growing sense of community
- Increased interest in the capabilities of citizen scientists worldwide

*For Safecast as a project, the intangibles are arguably as important as the metrics.*

‘...Safecast is as crisp an example as we have for how mutualism can serve as a successful workaround for failure (whether for lack of capacity or, more likely, for lack of political will) of a public body.’

(Benkler, 2013)

## **SUMMARY:**

Though groups like Safecast can help fill crucial gaps, ultimately the timely provision of data that citizens need to make informed decisions about their livelihoods and well-being is the government's responsibility.

The rise of citizen science should be seen as a very positive development, one of the few bright spots that have emerged following the Fukushima disaster.

## **SUMMARY:**

The technical capabilities occasioned by the open-source and digital fabrication movements are poised to put increasingly sophisticated scientific and communication tools in the hands of average citizens worldwide.

This will continue to require social and regulatory accommodation and adjustment as governments and other established stakeholders grow to understand the implications of the changing information landscape and, hopefully, are motivated to reach mutually beneficial relationships with citizen scientists like those at Safecast.
