LIMITED INFLUENCE OF CLIMATE CHANGE MITIGATION ON SHORT-TERM GLACIER MASS LOSS

universität innsbruck

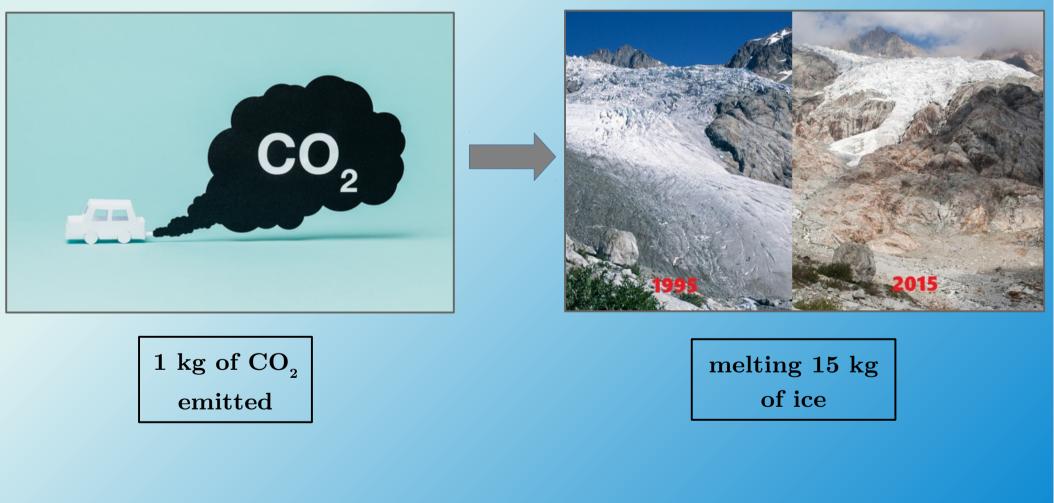

INTRODUCTION (1/3)

Glaciers are in disequilibrium with the current climate:

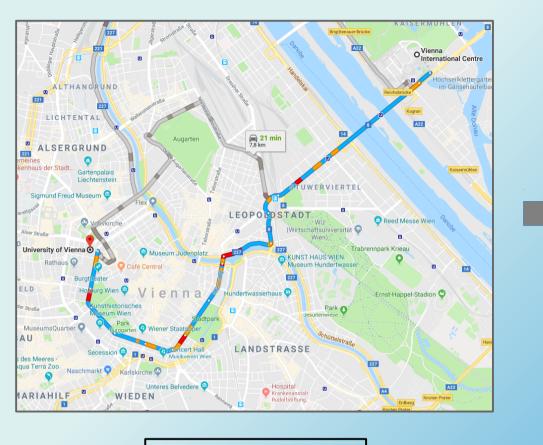

- \rightarrow long-term commitment of glacier mass loss !
- \rightarrow but not yet realized ...

Source: Ecrins National Park, France

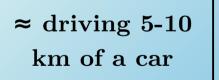

INTRODUCTION (2/3)

≈ melting 13 liquid water bottles

IN OTHER WORDS, EVERY DAY **WE** PARTICIPATE TO THE DISAPPEARANCE OF GLACIERS ...

Nicolas Champollion

INTRODUCTION (3/3)

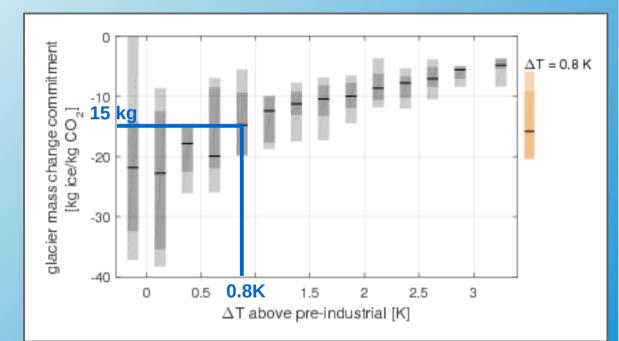

We found that under present-day climate conditions, every emitted kg of CO_2 will eventually be responsible for a glacier mass loss of 14.8 +- 5 kg (equilibirum experiments).

Main results:

A. mass loss commitment is not already realized

B. relationship between CO_2 emission and glacier mass loss decreases with time:

- global glacier mass decreases with time
- mass balance / elevation feedback
- C. mass loss commitment is additive
- D. previous mass loss commitment is omitted

GLACIER MASS LOSS COMMITMENT (3/3)

Universität Bremen*

<u>Current climate</u>: around 36% of the total glacier ice mass is committed to melt.

Paris agreement (1.5 & 2K): 50 to 60% of the total glacier ice mass is committed to melt.

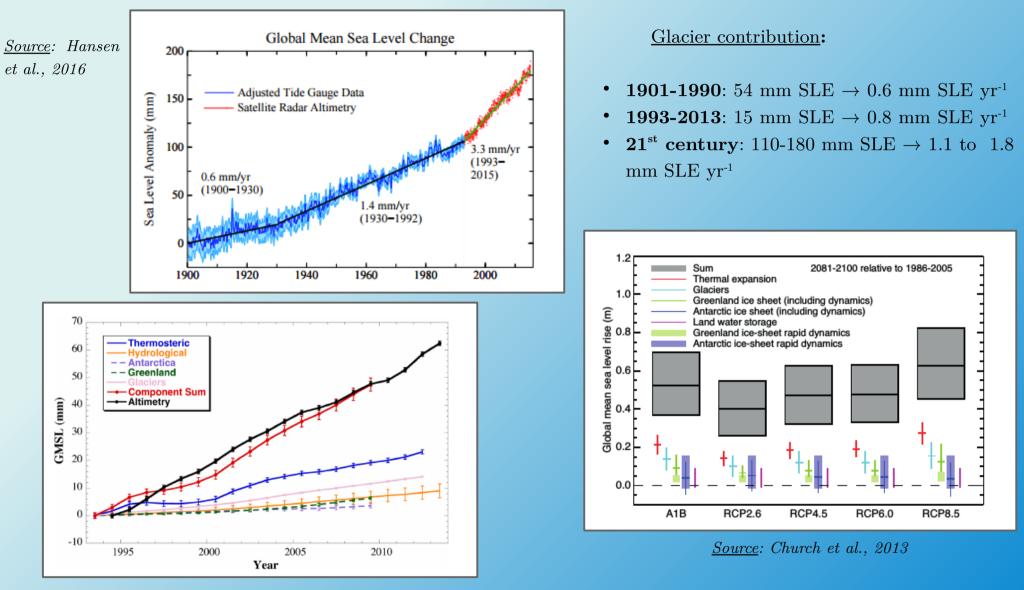

Source: Champollion, pers. comm.

Antarctica & Greenland peripheral glaciers are not included – Global glacier ice mass is uncertain.

GLOBAL MEAN SEA LEVEL

The past, present and future contribution of glaciers to sea-level rise are 30 - 35% of the total sea-level rise.

21^{st} Century Glacier Evolution (1/3)

But not all the glacier mass loss commitment is going to happen, at least for the 21^{st} century, and if humans are doing something !

What does it represent transitory ?

FIGURE 13 | Comparison of modeled twenty-first century sea-level equivalent from glacier mass loss based on previous assessments included in IPCC (2013) with results from this study. Circles refer to multi-model means from 8 to 15 GCMs and bars indicate ±1σ. Previous results are recomputed to refer to the period 2010-2100 -by assuming their average rates to be constant in time. Results of this study are given both as $SLE_{\Delta M}$ and SLE_{eff} while the results from previous studies denote $SLE_{\Delta M}$.

2015

With our glacier model, we showed the low influence of climate change mitigation on glaciers due to the current climate glacier mass loss commitment !
