Global Interest of AR

- Intensive and persistent moisture transport for the Jan 1995 French flood

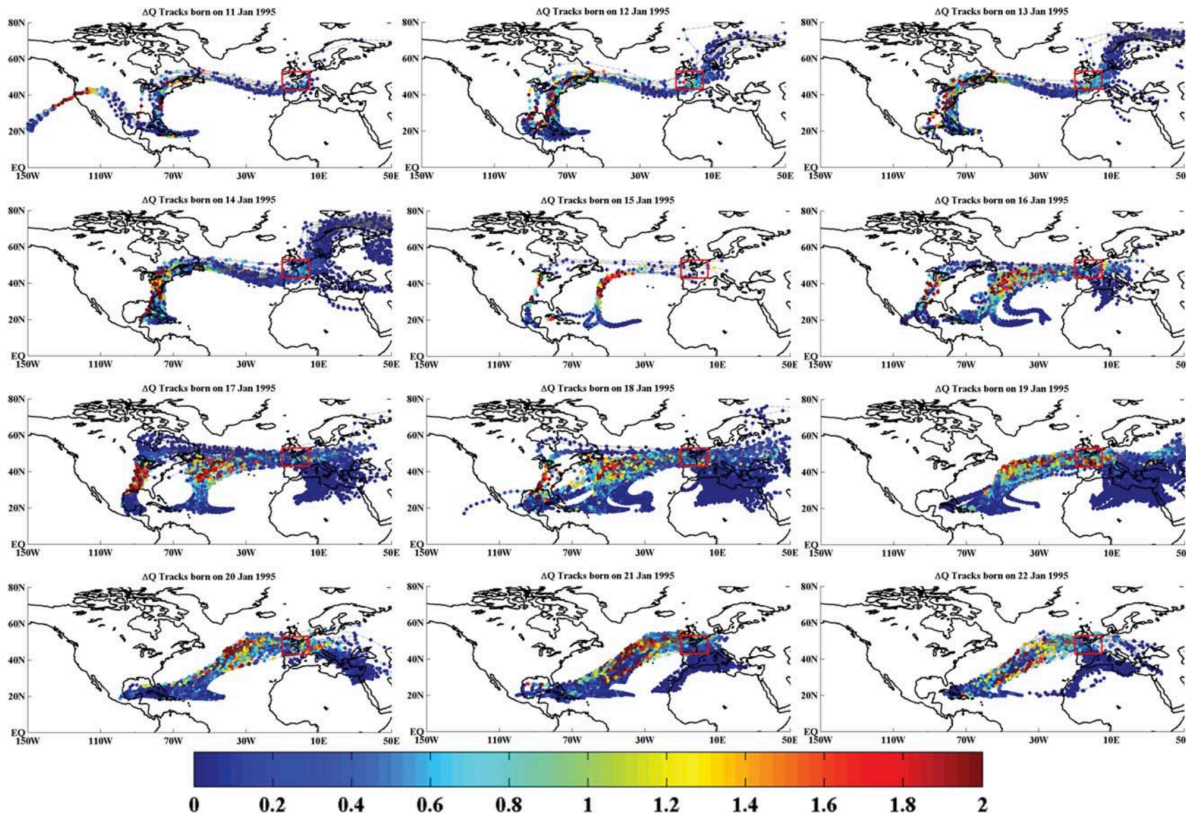

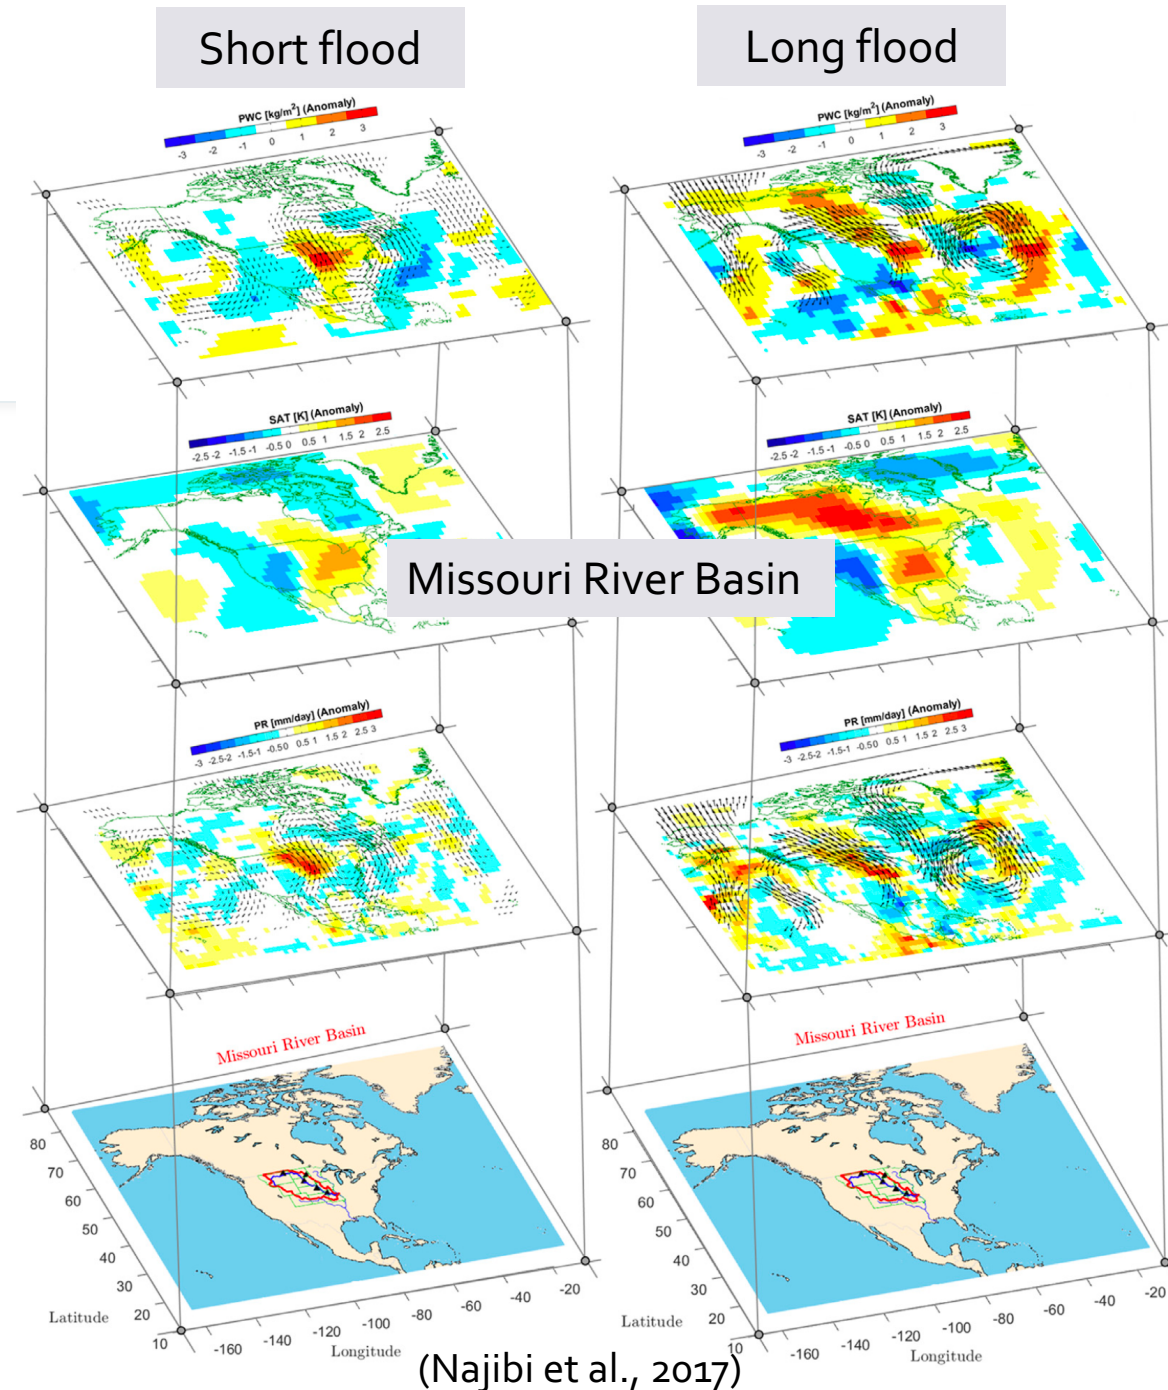

Figure 3. TME tracks born on the 11th to the 22nd of January (from left to right, then from top to bottom), colors depicting moisture release from the air parcel in the study area during heavy rainfall period from the 17th to the 28th of January in 1995. The red box highlights the flooded area. The color bar indicates the specific humidity change (g/kg).

Development of AR identification algorithms

More advanced algorithms:

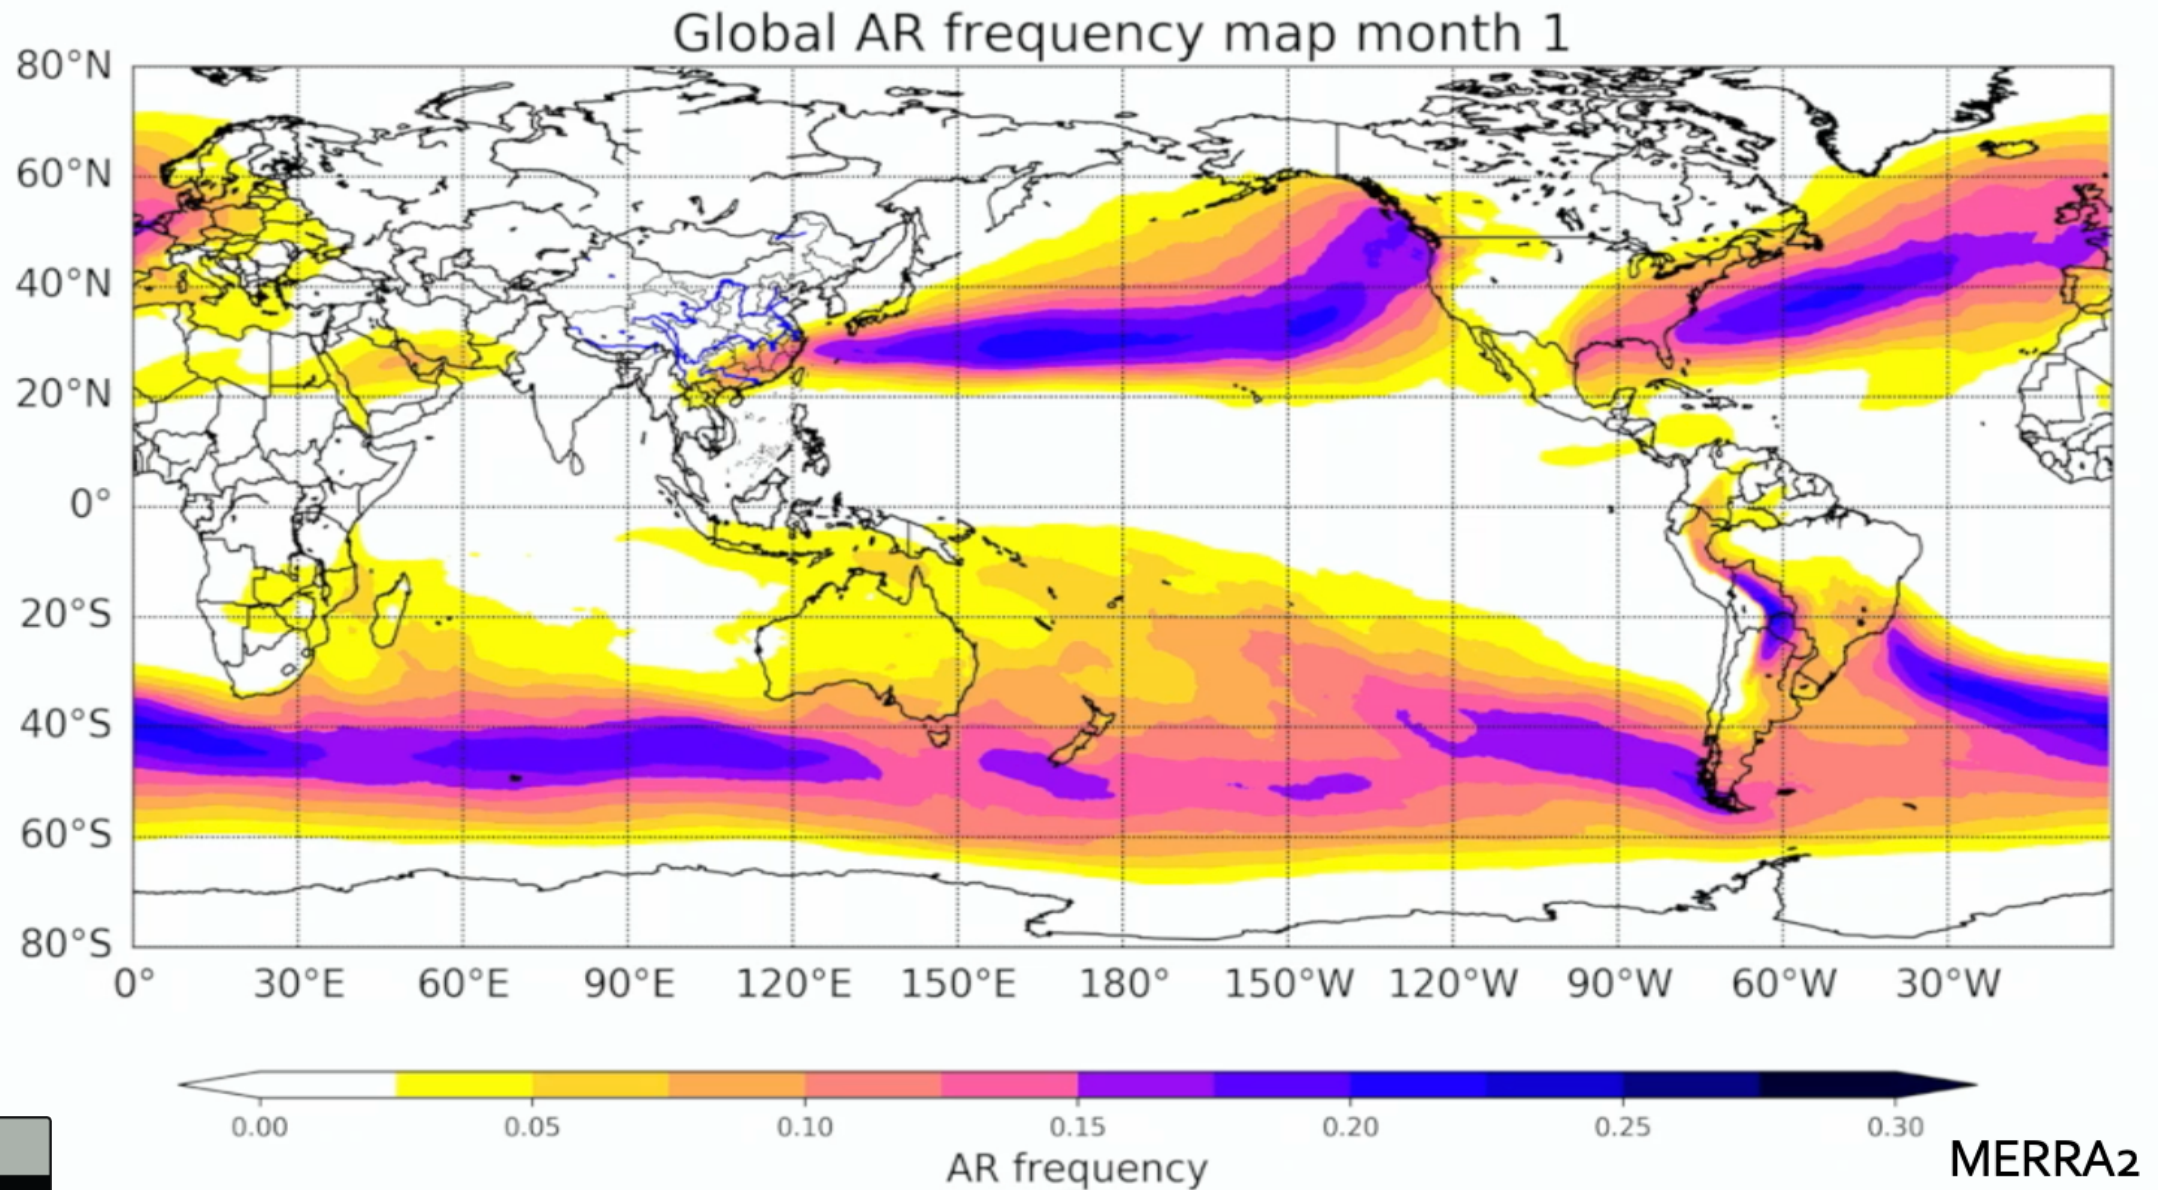

- Considered the **spatiotemporal variability** of moisture transport intensity.
- Tracked the whole **life cycle** of AR events.
- **Quantified ARs** with various metrics.

(Mundhenk et al., 2016; Sellars et al., 2017; Zhou et al., 2018; Payne & Magnusdottir, 2016;)

Motivation

- Robust algorithm applicable to East Asia
- Reliable metrics for ARs with varying shapes/orientations/curvatures
- Effective step to distinguish TC-like features
- AR “flavor”/structure analysis

In September 2019, we joined the ARTMIP project and contributed the AR global catalog (available at <http://www.cgd.ucar.edu/projects/artmip/>).

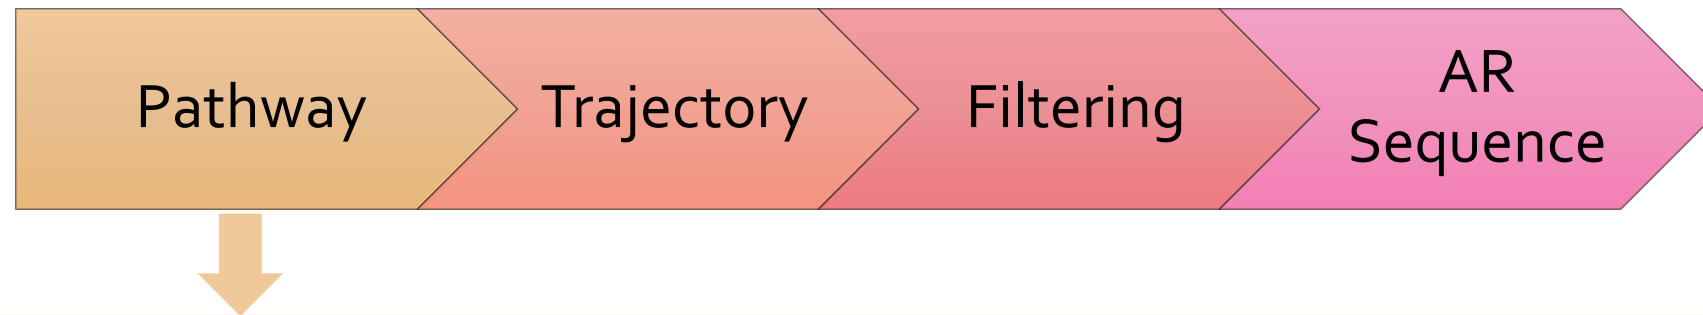

Quick Basics of the PanLu2.0

Pan & Lu, 2019;
Pan & Lu, 2020 (under review)

1. IVT based

2.

Dual thresholds

- Local threshold: spatially smoothed (Gaussian Kernel density smoother) 85% IVT intensity quantile
- Regional threshold: 80% IVT quantile in the entire AR detection region
- Seasonality is considered by a three-month window for both monthly local & regional thresholds.

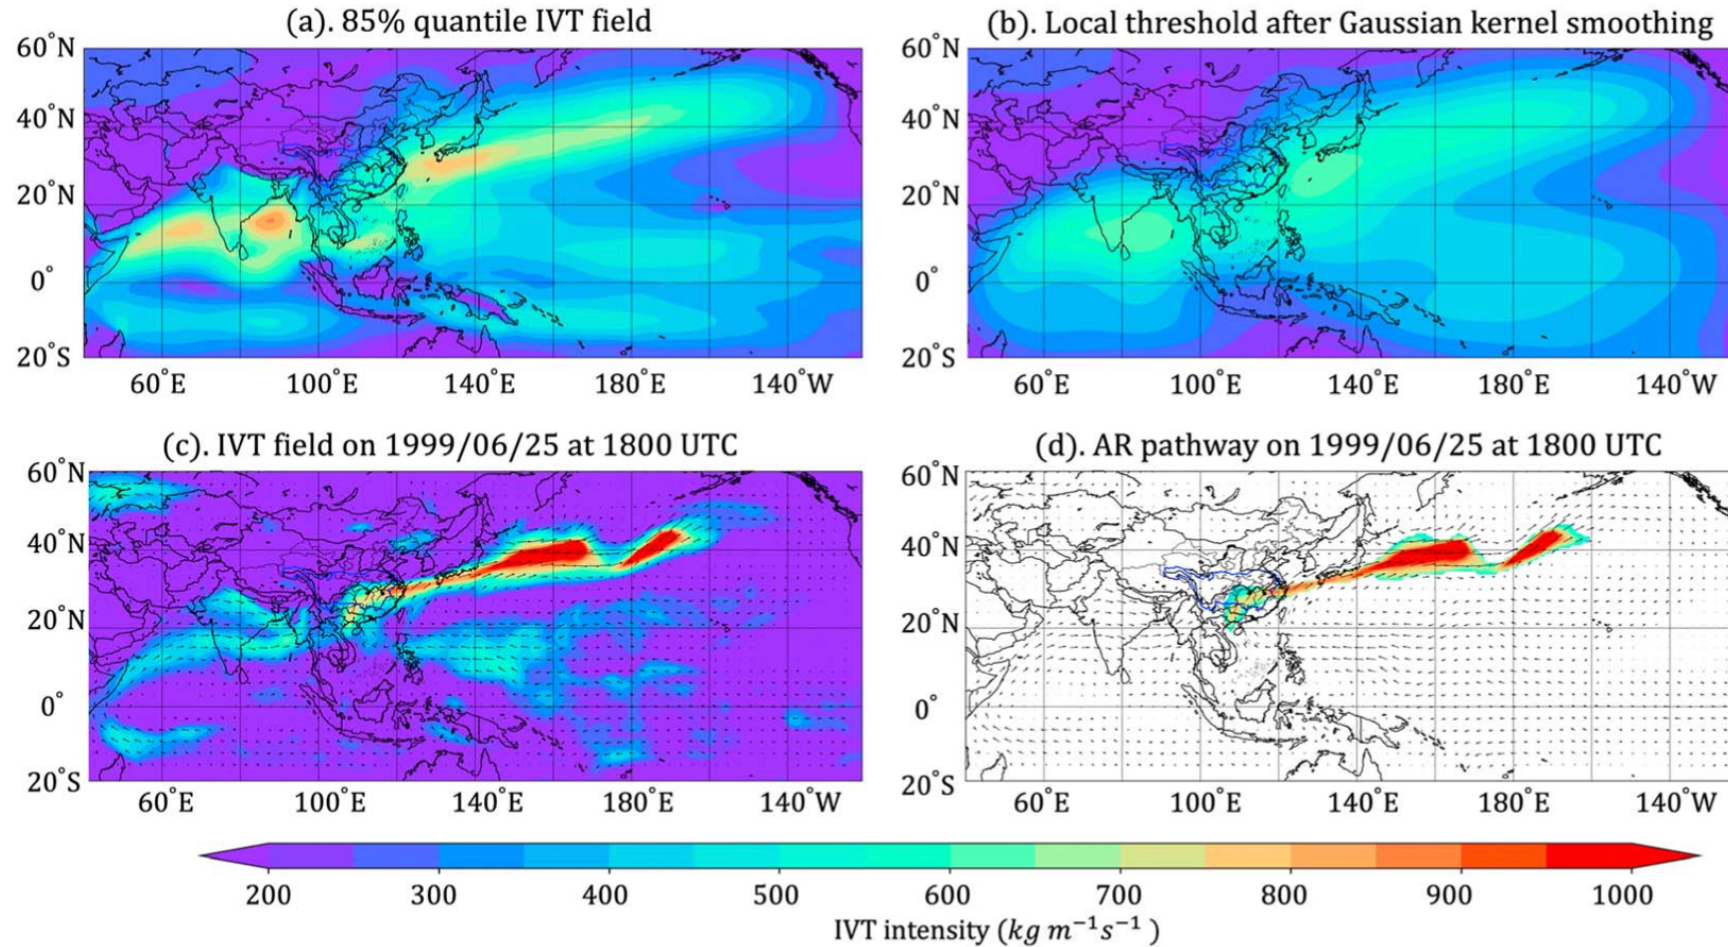

Figure 3. An example of AR pathway detection. (a) The 85% quantile IVT field in the AR detection region (40°E to 120°W, 20°S to 60°N). (b) The local threshold by applying the Gaussian kernel density smoothing to the 85% quantile of IVT field. (c) The IVT field on 25 June 1999 at 1800 UTC. (d) The detected AR pathway based on the IVT field in (c). AR = atmospheric river; IVT = integrated water vapor transport.

Quick Basics of the PanLu2.0

Pan & Lu, 2019;

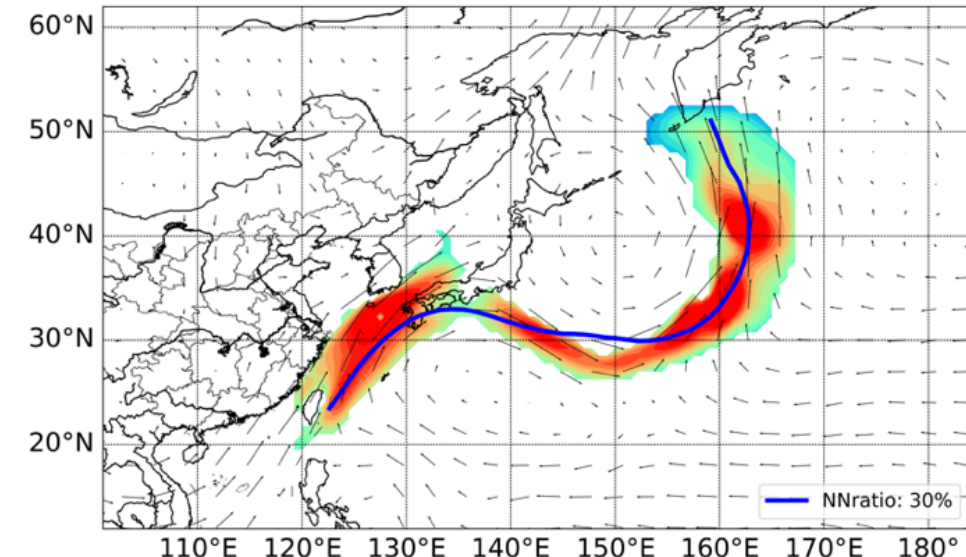

Pan & Lu, 2020 (under review)

1. IVT based

2.

- “Nearest neighbors + K-means + local regression” inspired approach to search for next “centroid”
- Two directional (forward/backward) search by moving **centroid** along the weighted IVT direction

- "Nearest neighbors + K-means + local regression" inspired approach to search for next "centroid"
- Two directional (forward/backward) search by moving **centroid** along the weighted IVT direction

- ▲ C forward new search point
- ▲ E backward new search point
- ★ D new forward centroid
- ★ F new backward centroid

▲ A Initial search point

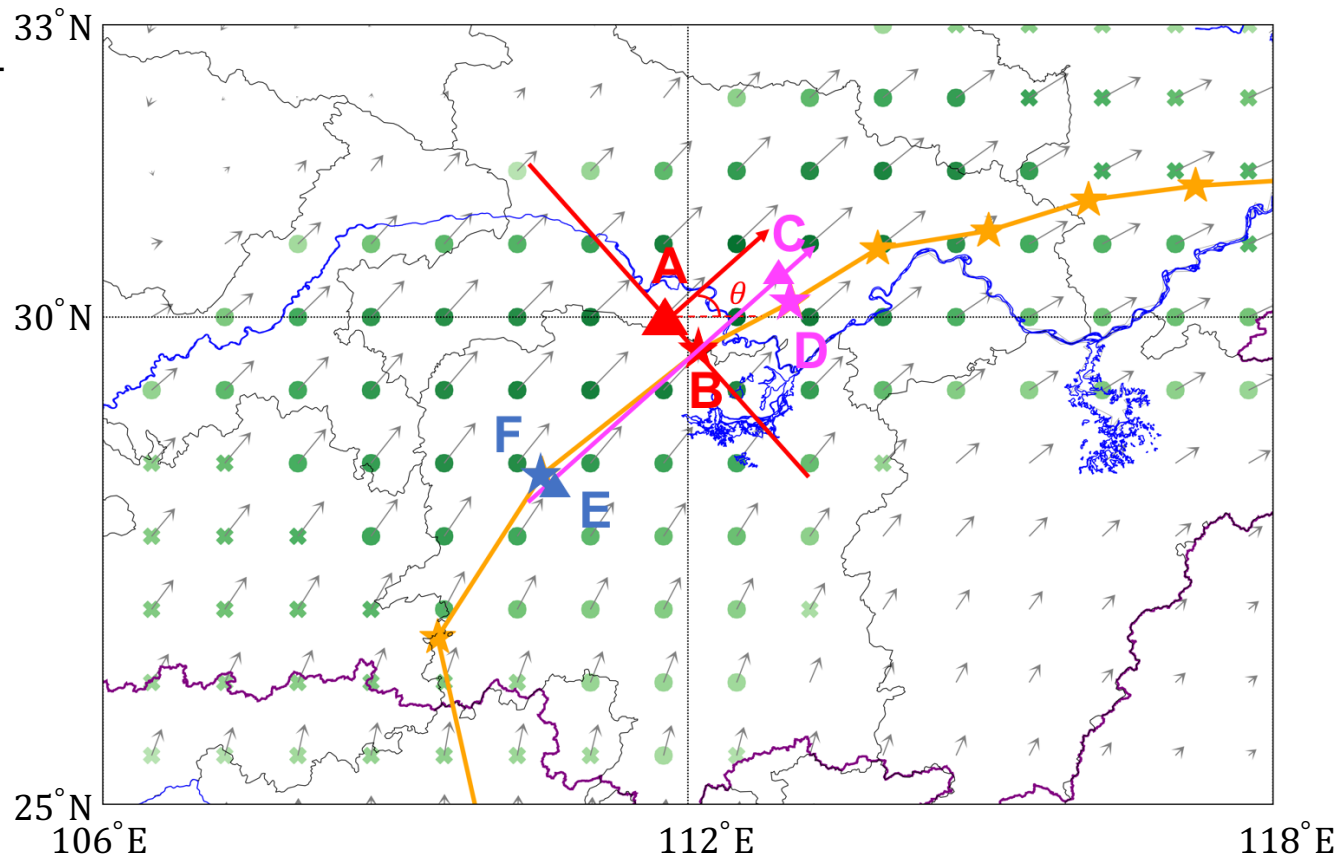

● Selected nearest neighbors

✕ Not selected points

Weighted IVT direction

Cross section

Centroid

Quick Basics of the PanLu2.0

Pan & Lu, 2019;

Pan & Lu, 2020 (under review)

1. IVT based

2.

▪ Spatial and temporal continuity

▪ Computer geometric metrics:

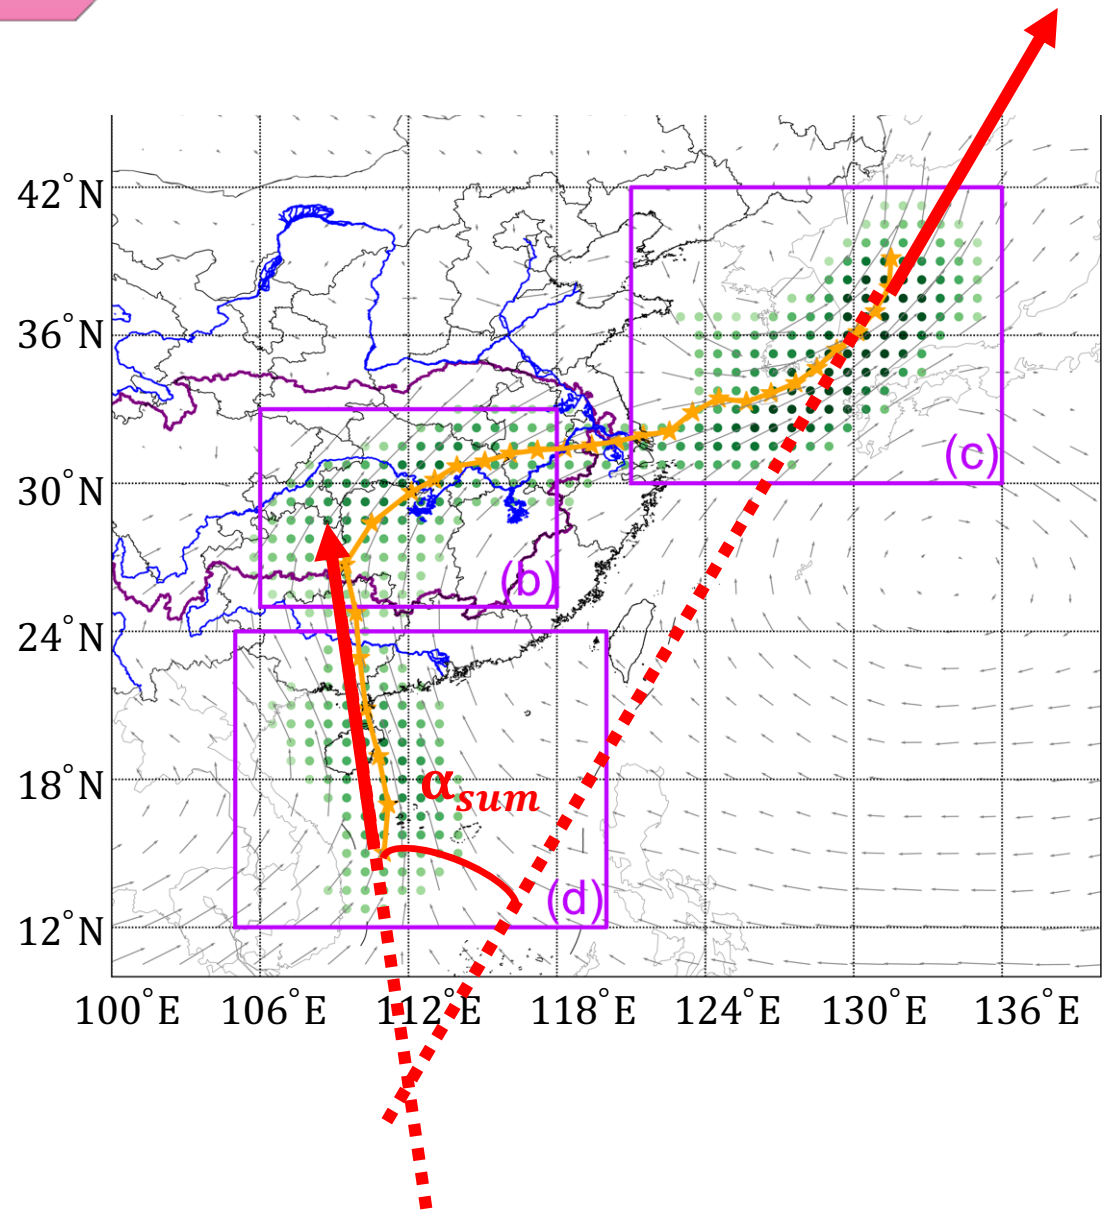

length, width, LWratio, turning angle series (α_i , $\alpha_{sum} = \sum_{i=2}^{n-1} \alpha_i$)

▪ Eliminate ARs

whose length < 2000km, or LWratio < 2 or any $\alpha_{sum} > 360^\circ$

- Computer geometric metrics:
length, width, LWratio, turning angle series ($\alpha_i, \alpha_{sum} = \sum_{i=2}^{n-1} \alpha_i$)
- Eliminate ARs
whose length < 2000km, or LWratio < 2 or any $\alpha_{sum} > 360^\circ$

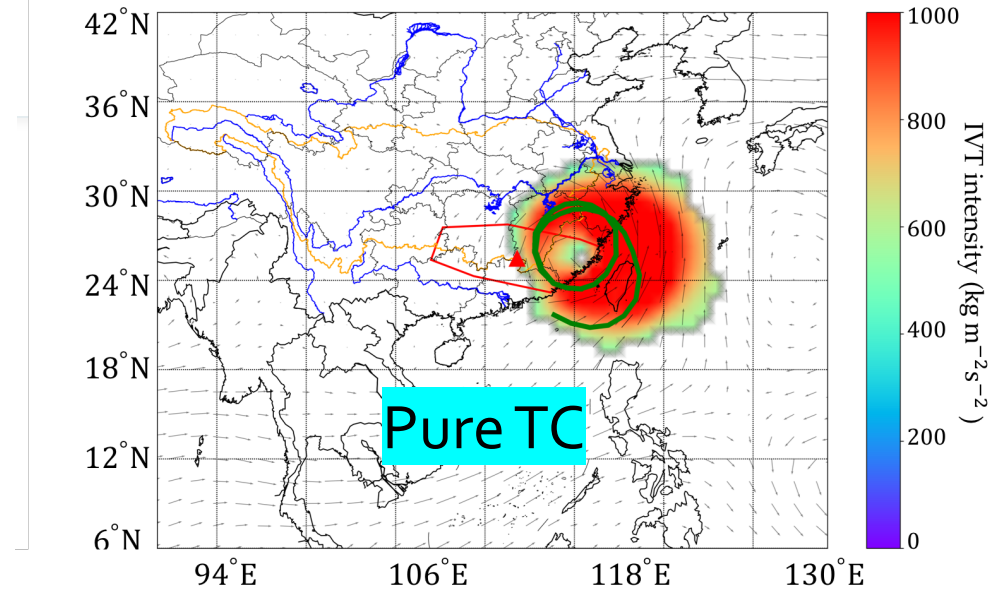

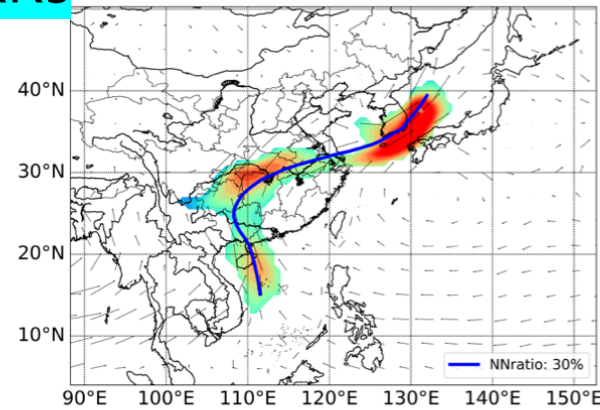

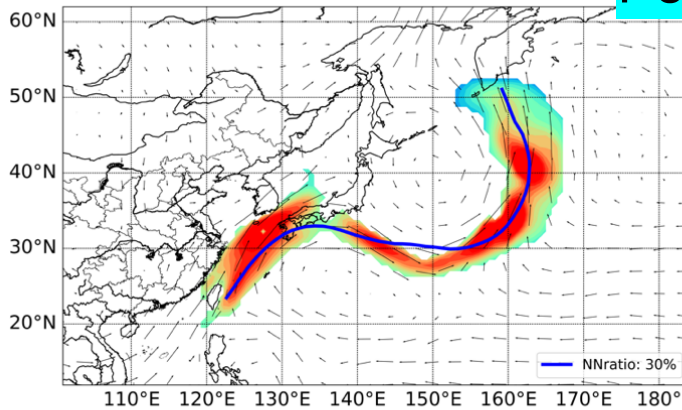

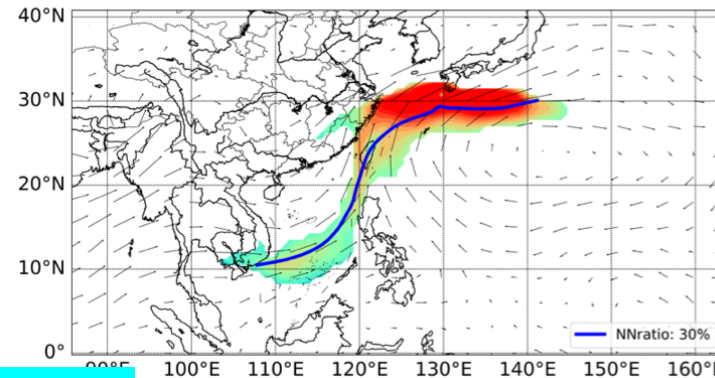

Performance

❖ Smooth curve that captures the varying shape/curvature of various ARs

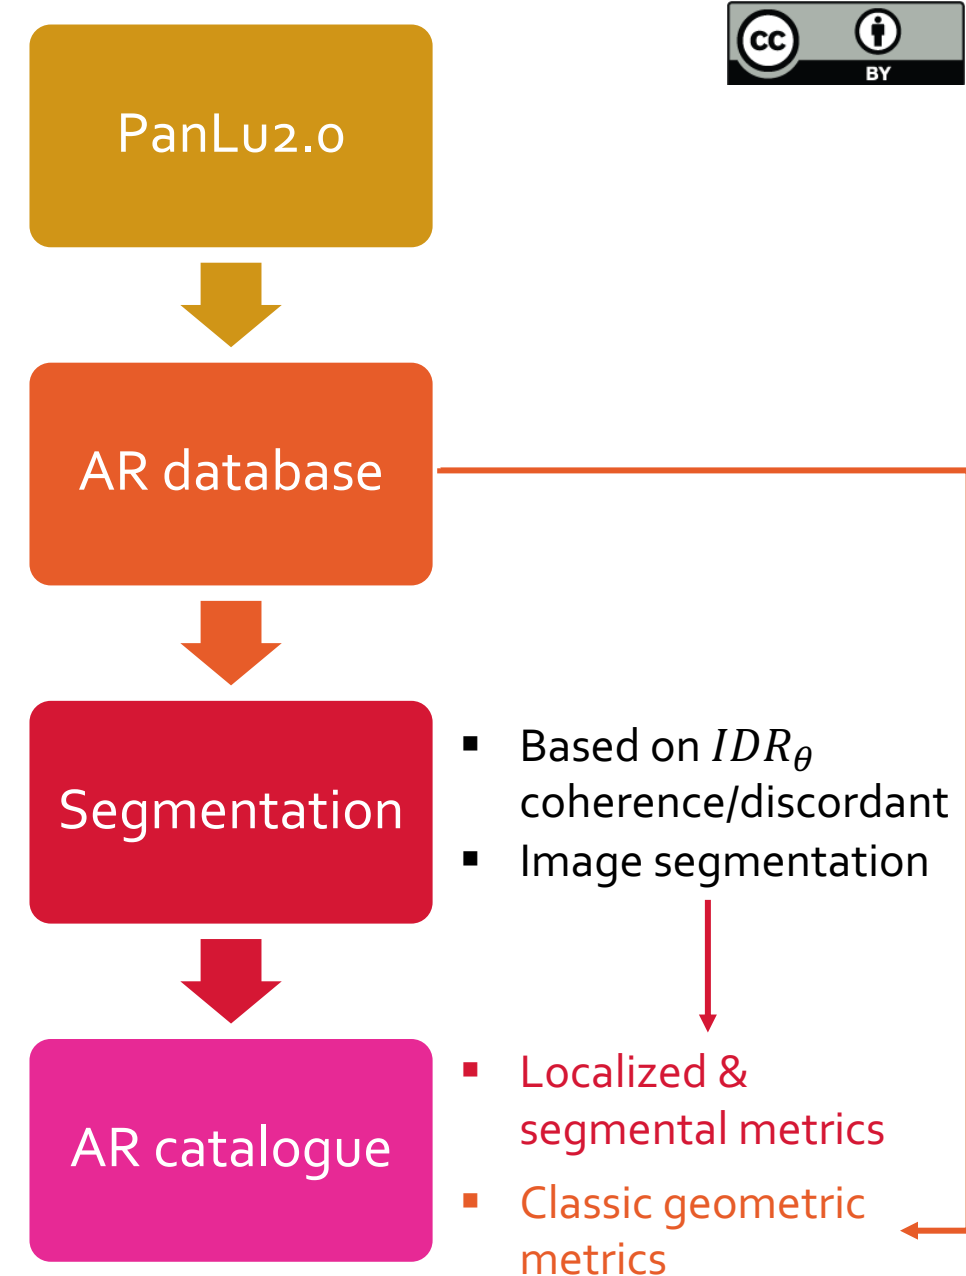

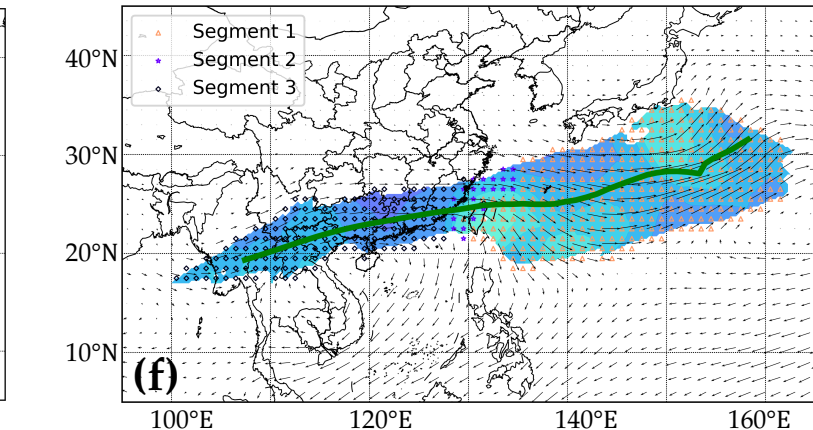

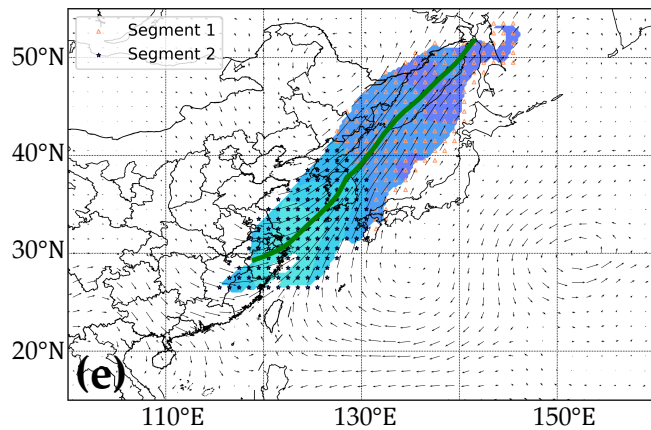

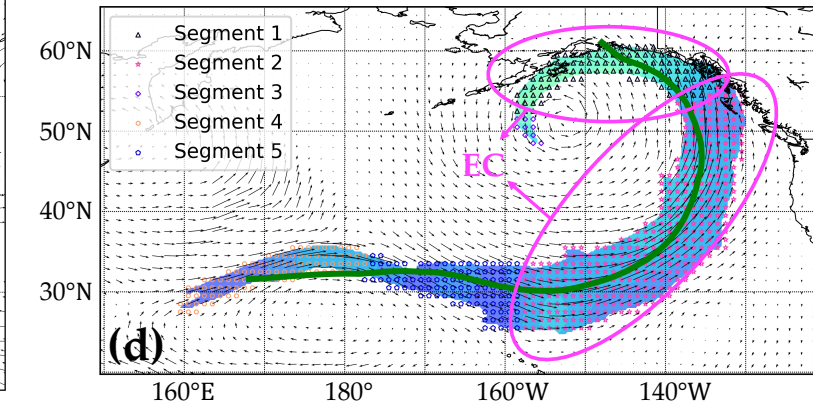

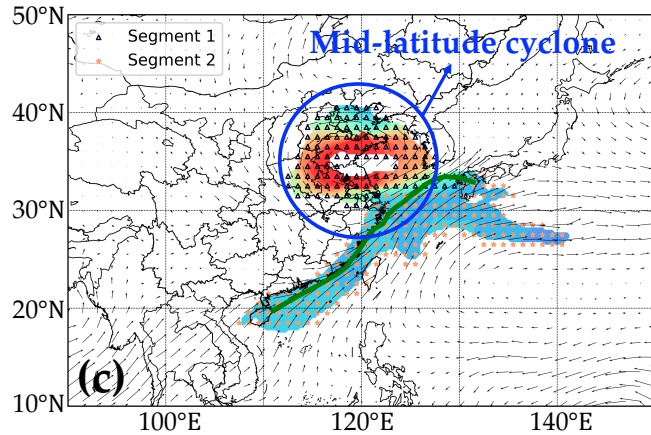

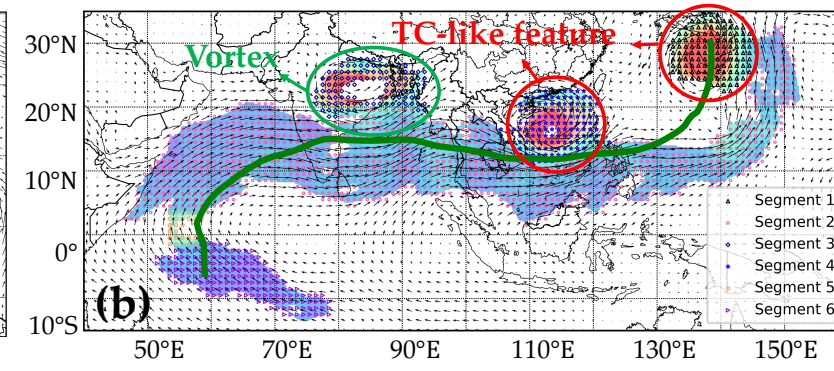

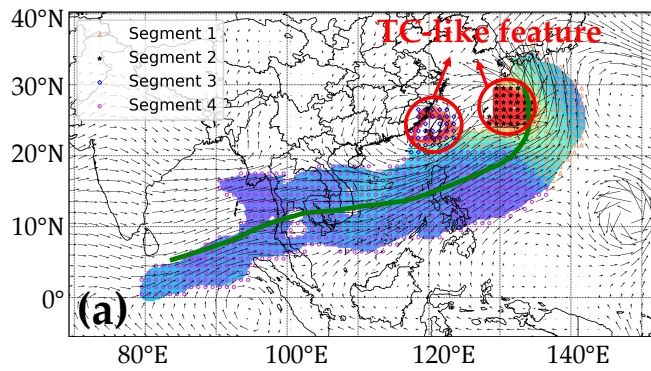

Pure ARs

What about ARs with different “flavors”?

EA AR catalog in Pan & Lu 2020 (under review)

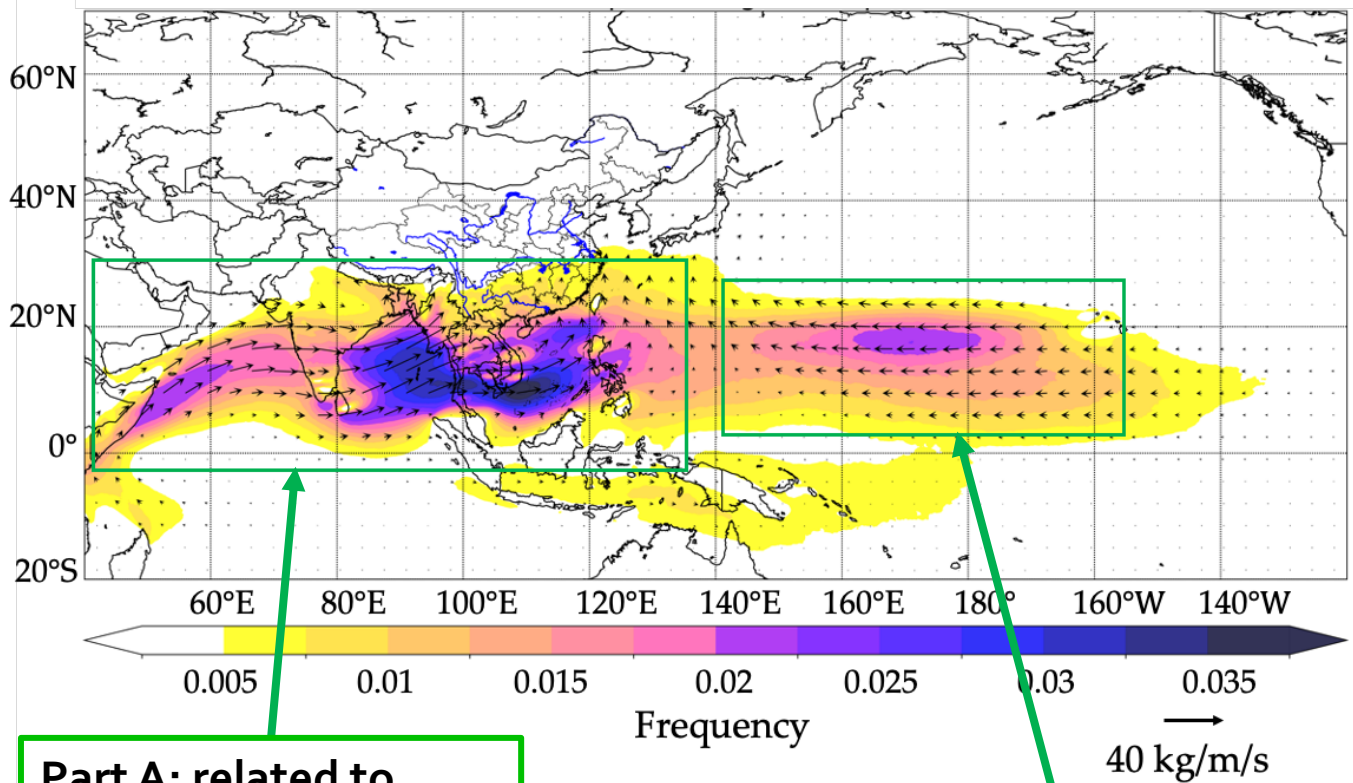

Some reminders

1. Differentiate TMFs from ARs

- When we apply some previous methods by others to EA

1. IVT direction based → midlatitudes ARs are discarded
2. AR location → ARs from south Asian summer monsoon region with substantial poleward moisture transport is discarded; ITCZ seasonal shift is not considered

TMF Elimination

**Part A: related to
South Asian monsoon**

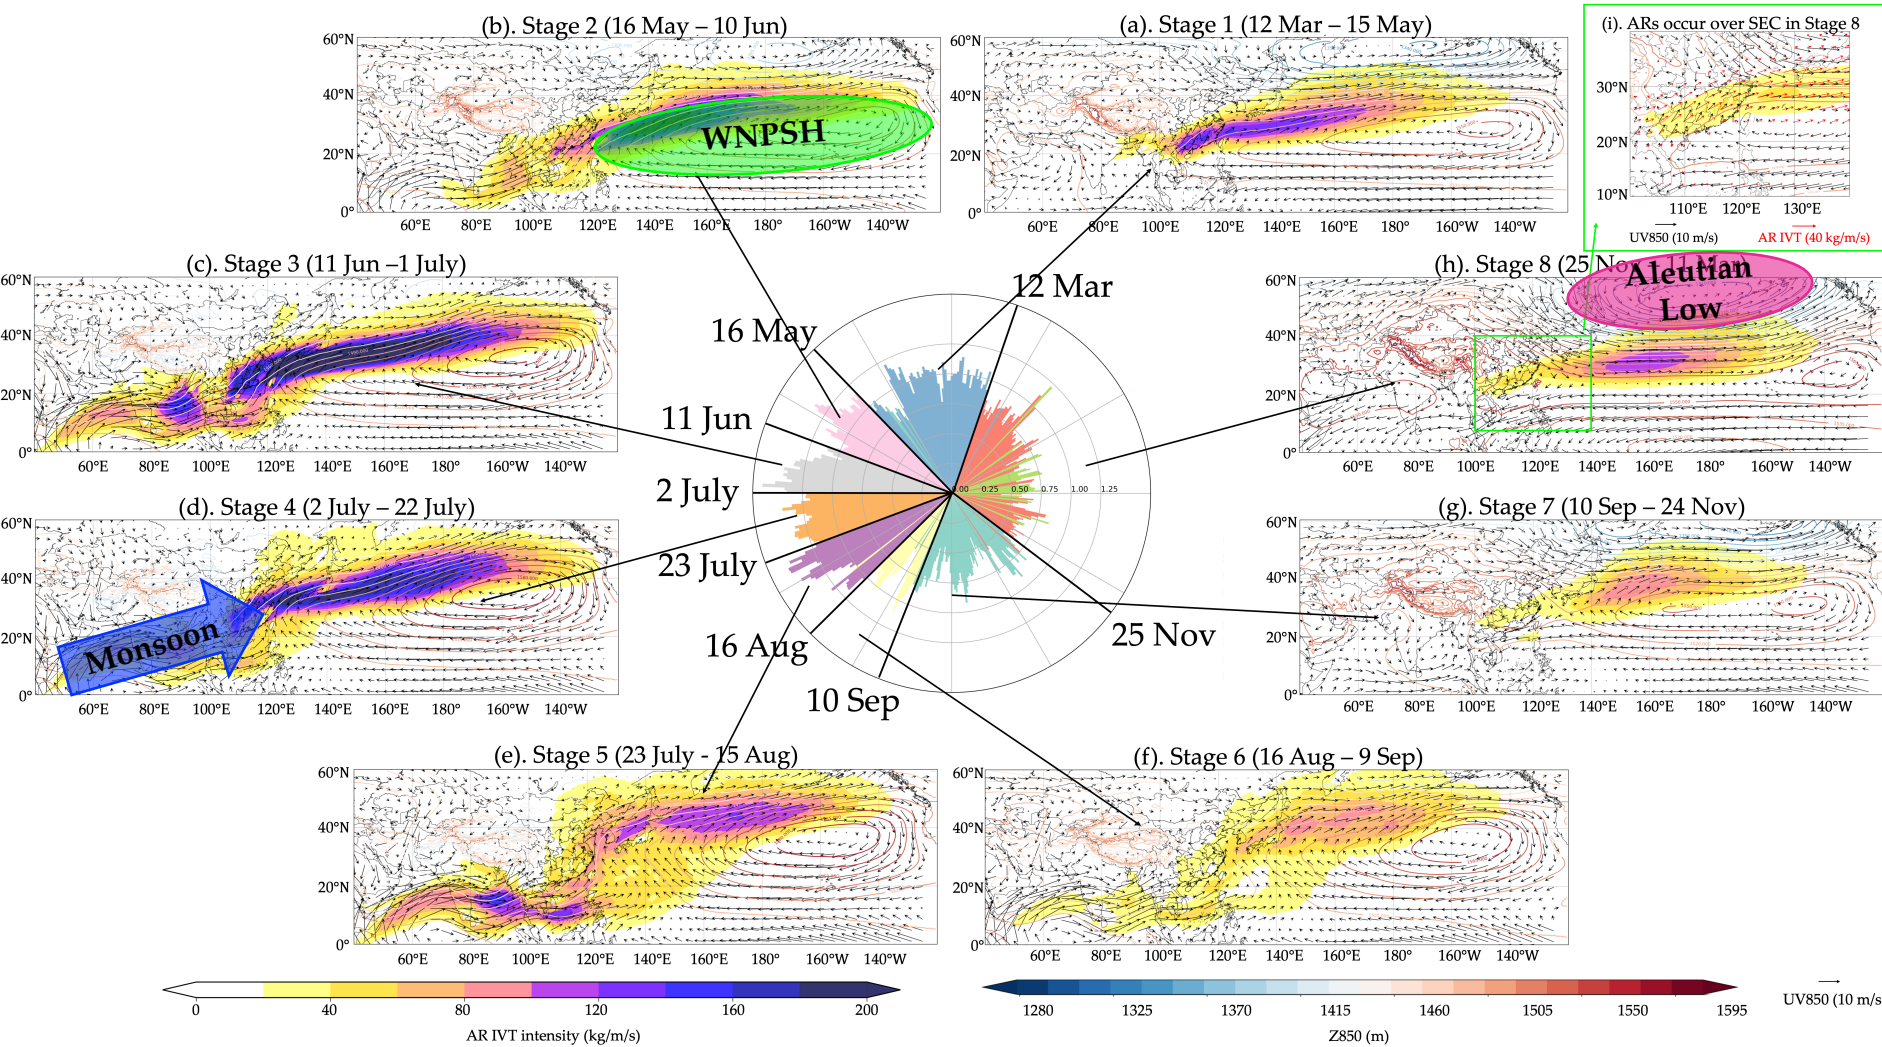

**Part B: Tropical
moisture filament**

■ We implement a two-step criterion to distinguish TMFs from ARs.

- 1). Marginal extratropical components despite of their IVT directions
- 2). Long residency in tropics and limited poleward component, which reserves the Part A and eliminate Part B successfully

Why should we care the internal structure of AR?

“We believe that distinguishing these systems thus understanding the underlying physical mechanism are tantamount to the identification of AR.” (Pan & Lu, 2020)
