Continuous monitoring of ground deformational scenario of Veneto region (Italy) through Sentinel-1 data

Pierluigi Confuorto, Silvia Bianchini, Davide Festa, Federico Raspini, and Nicola Casagli

Question

Why nowadays is it possible to make a continuous and systematic satellite-based monitoring service of ground deformation at a regional scale?

The answers

All the technologies essential to continuously survey the territory are nowadays available

Sentinel-1 (ESA) is designed to regularly acquire continuous deformation data on a national and regional scale

InSAR technology is exhaustive and Italy is one of the most InSAR-advanced countries

More and more automatized and complex **processing chains**

Increase of the **computational capacities** (parallel processings, cloud computing)

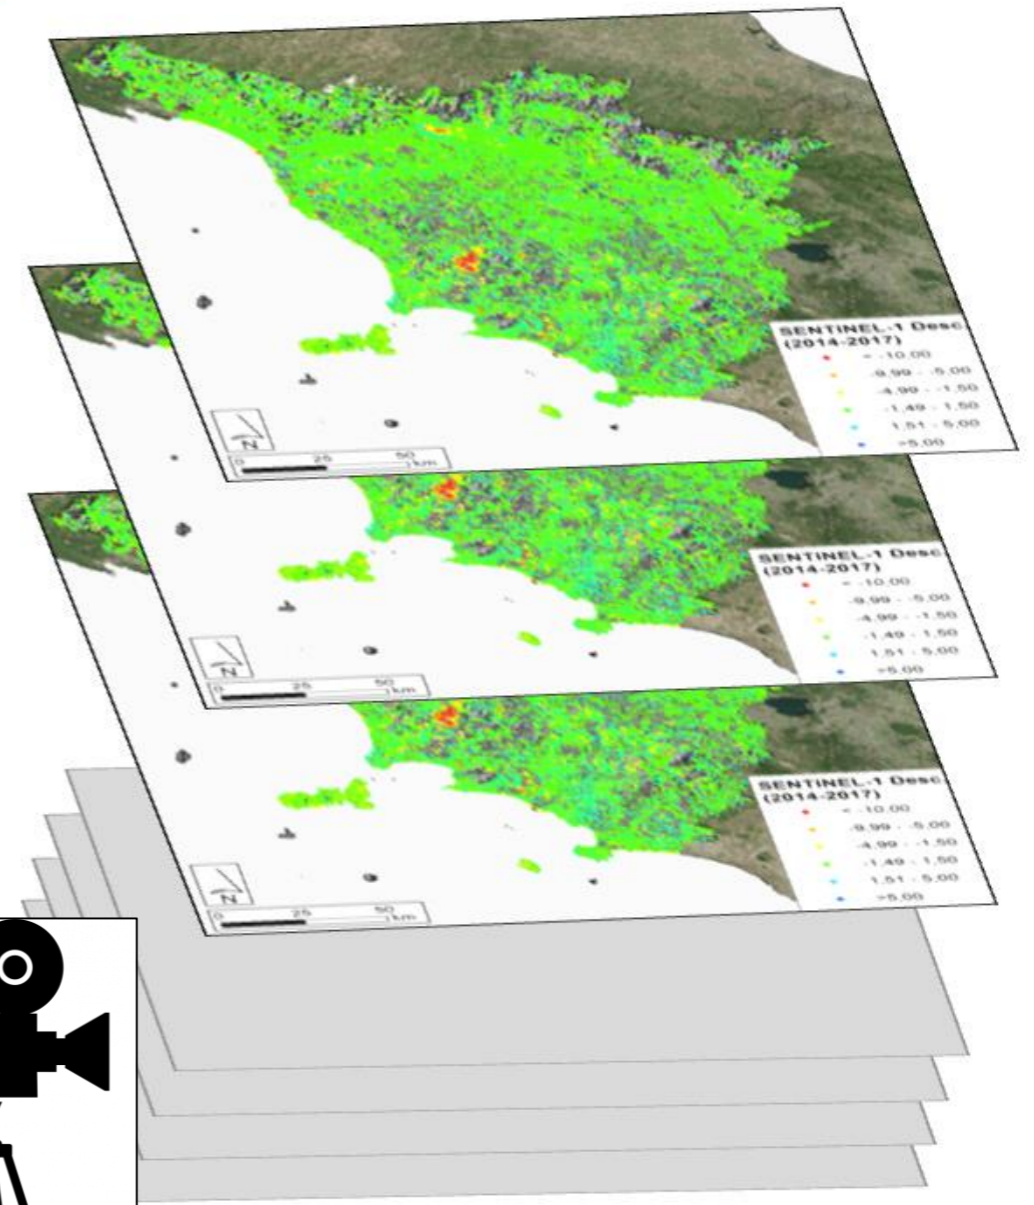

Sentinel-1A e -1B

- Two-satellites constellation(1A e 1B)
- C-Band SAR ($\lambda=56$ mm)
- Revisiting time: 6 days

Monitoring Project

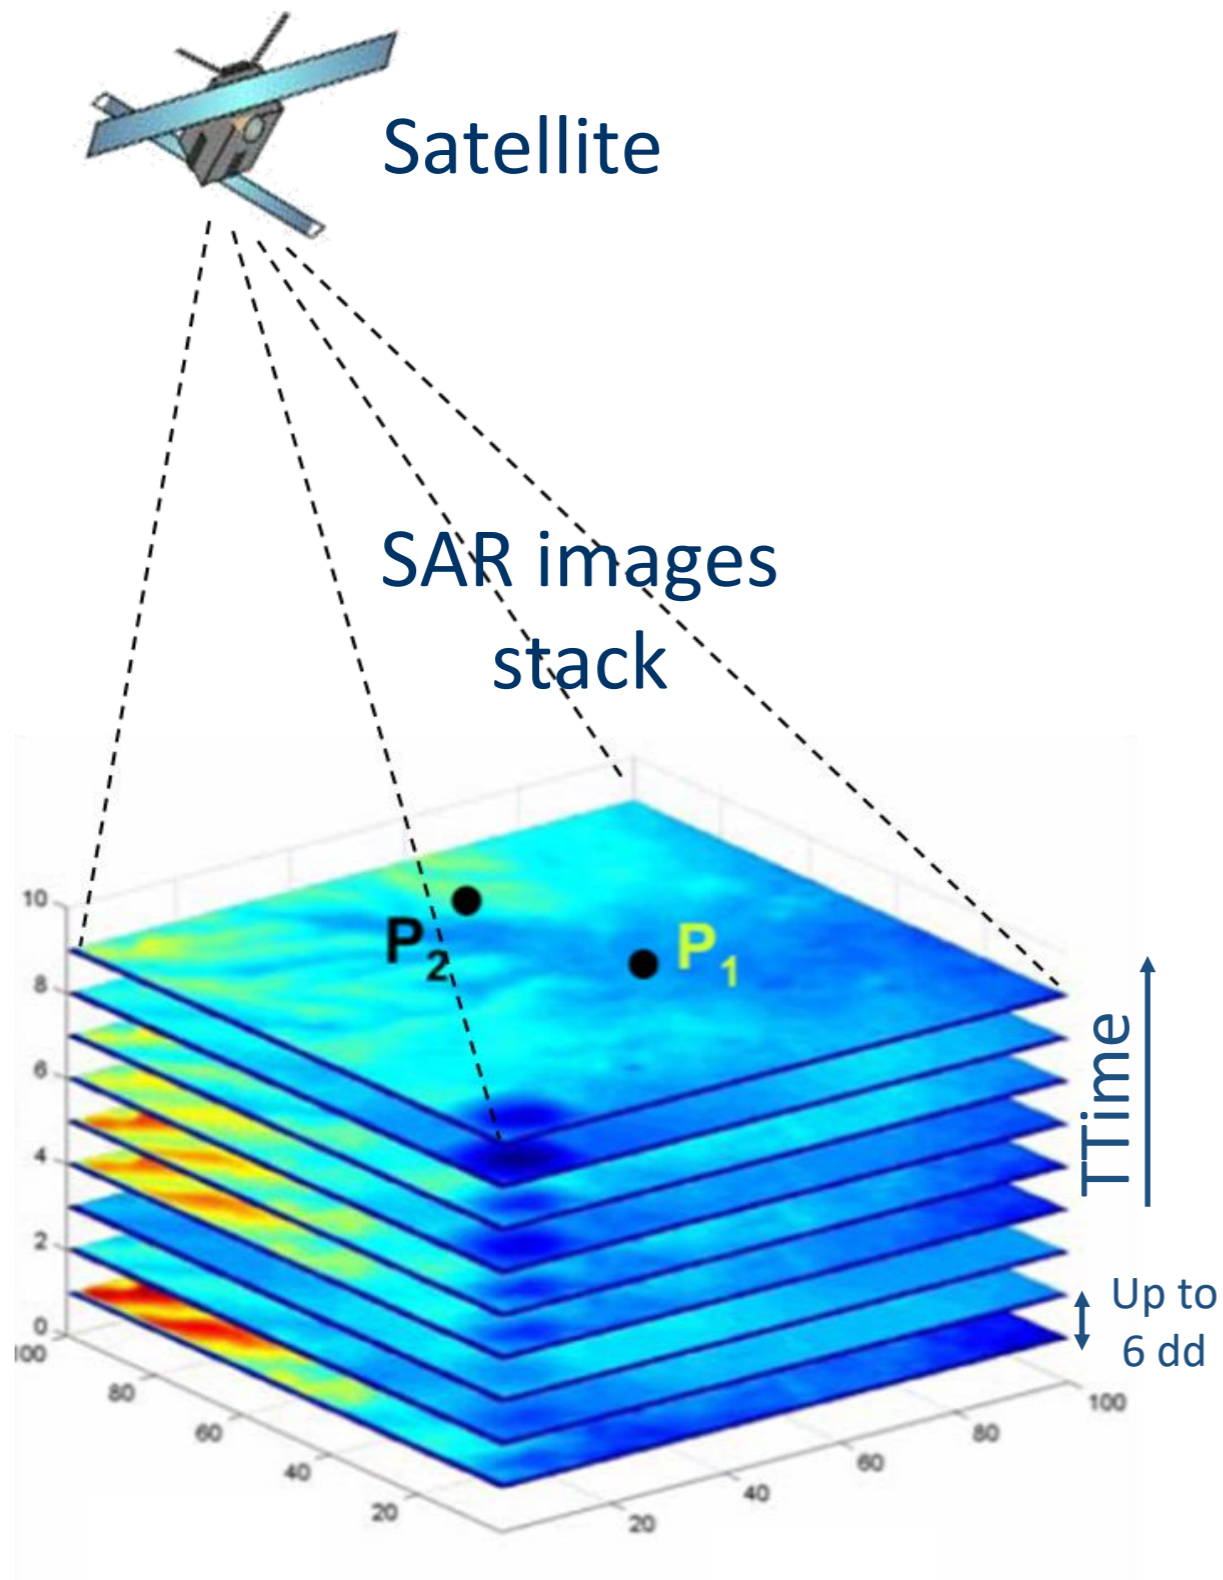

PS Continuous streaming at a regional scale

Revisiting time: 35 days

Revisiting time: 6-12 days

Spaceborne Radar Interferometry

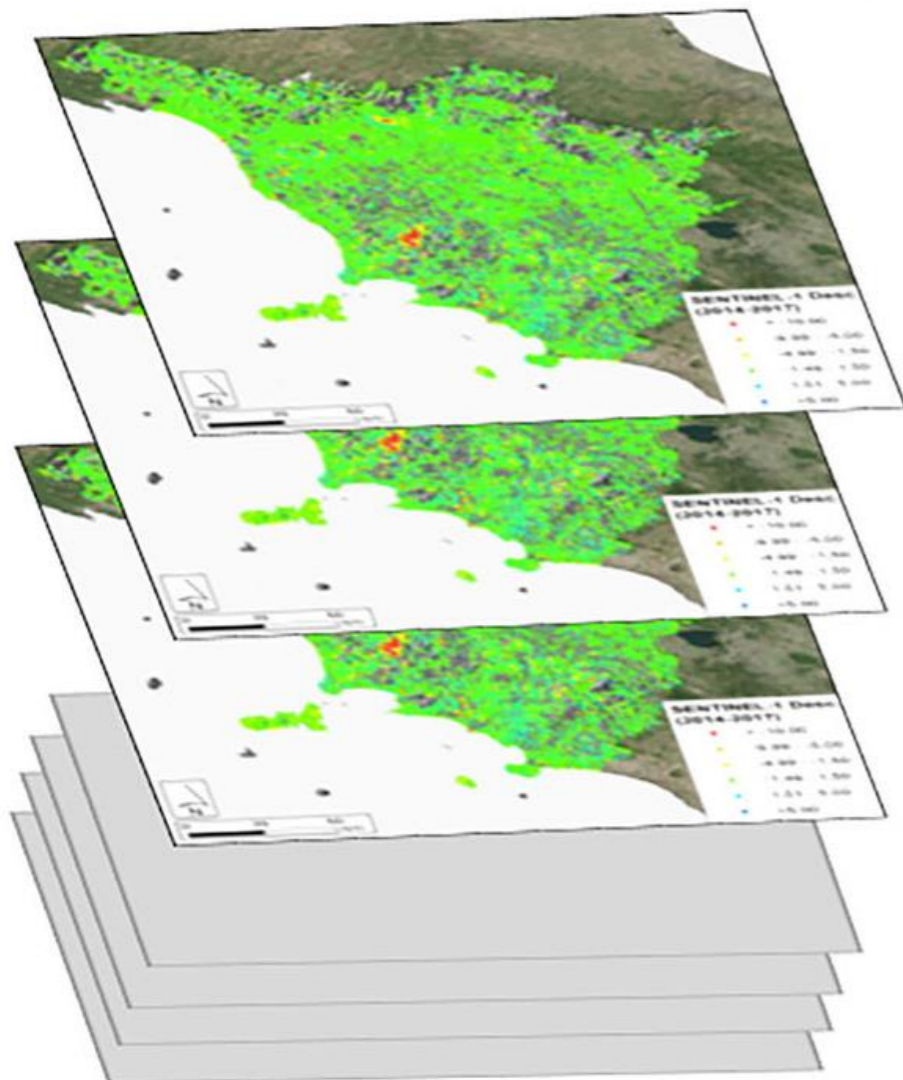

Average annual velocity along the LOS
(precision $\sim \pm 1$ mm/anno)

Time series of displacement
(precision $\sim \pm 1-5$ mm)

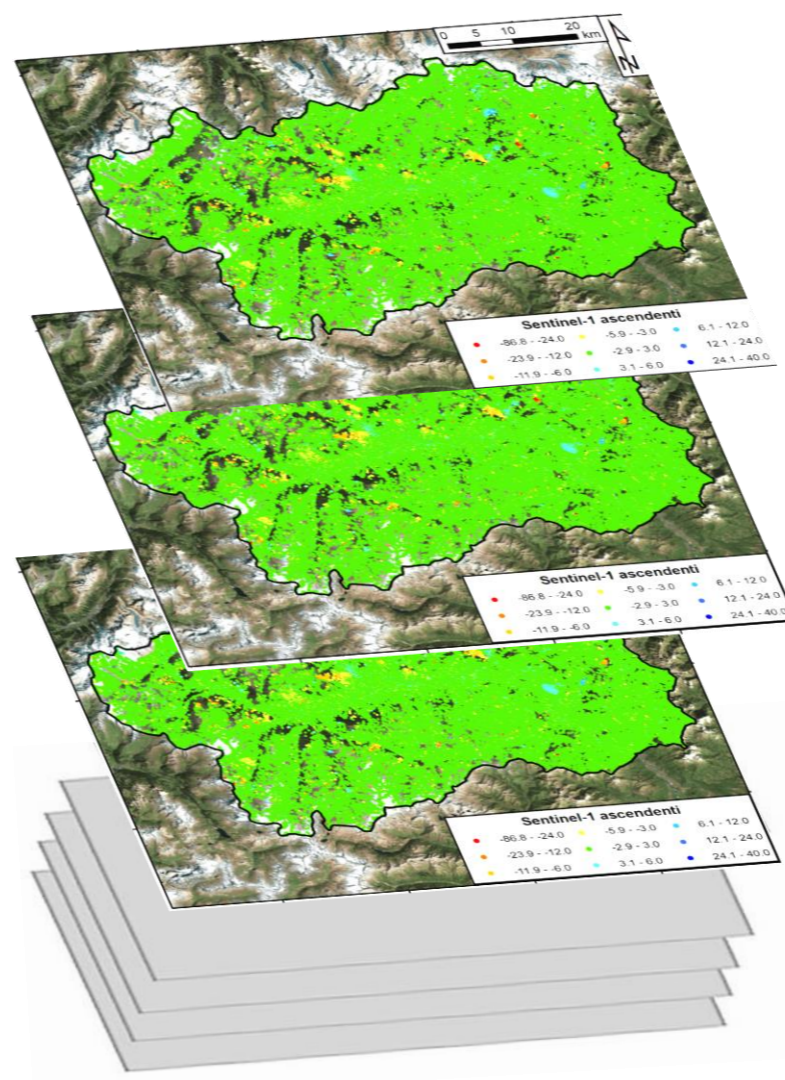

Continuous radar monitoring at a regional scale

Tuscany region

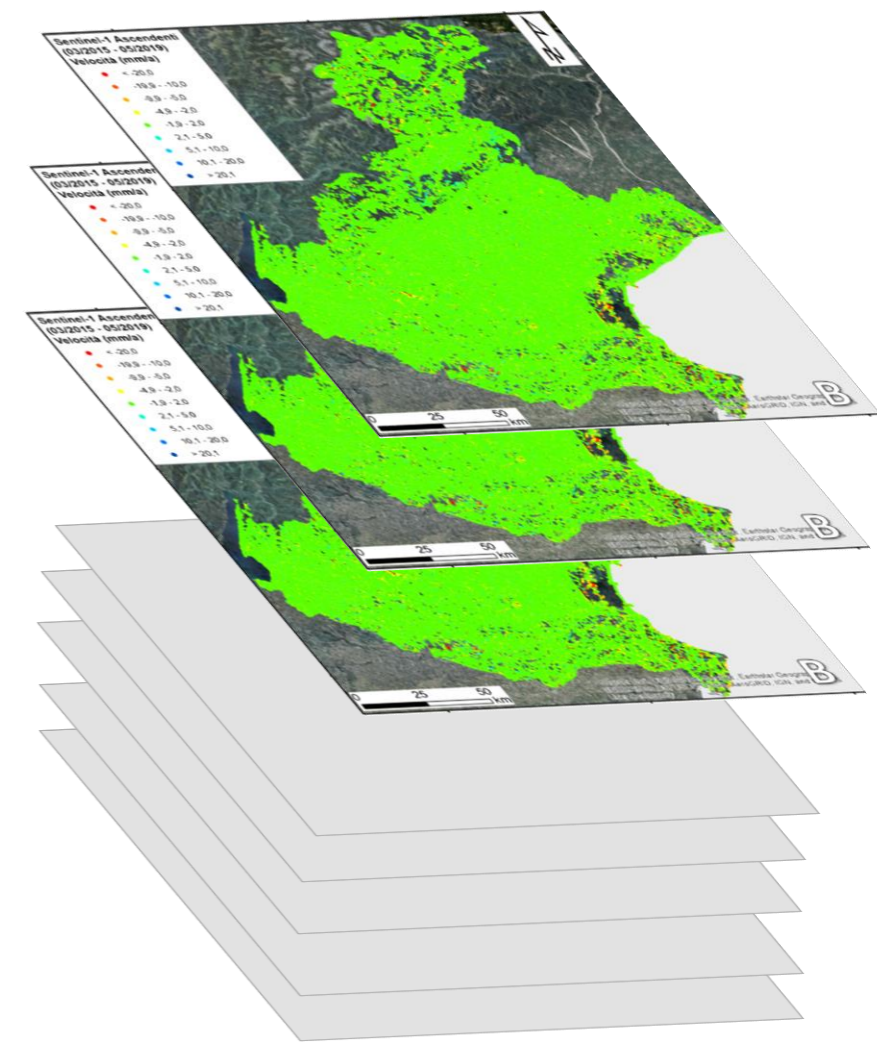

≈ 2.000.000 PSs

Valle d'Aosta region

≈ 700.000 PSs

Veneto region

≈ 3.000.000 PSs

Activities

	<i>PS Mapping</i>	<i>PS Monitoring</i>
Type	Product	Service
Time	«deferred»	«real»
Update	1 year	12 days
Aim	Planning/Update of landslide inventories	Operational alert system/monitoring

PS monitoring: real time monitoring (Dir. PCM 27/02/2004)

Updated analysis of time series of deformation

Anomaly: Variation of velocity $\Delta V > 10 \text{ mm/yr}$
in a recent time interval R

Veneto region

Tessina landslide

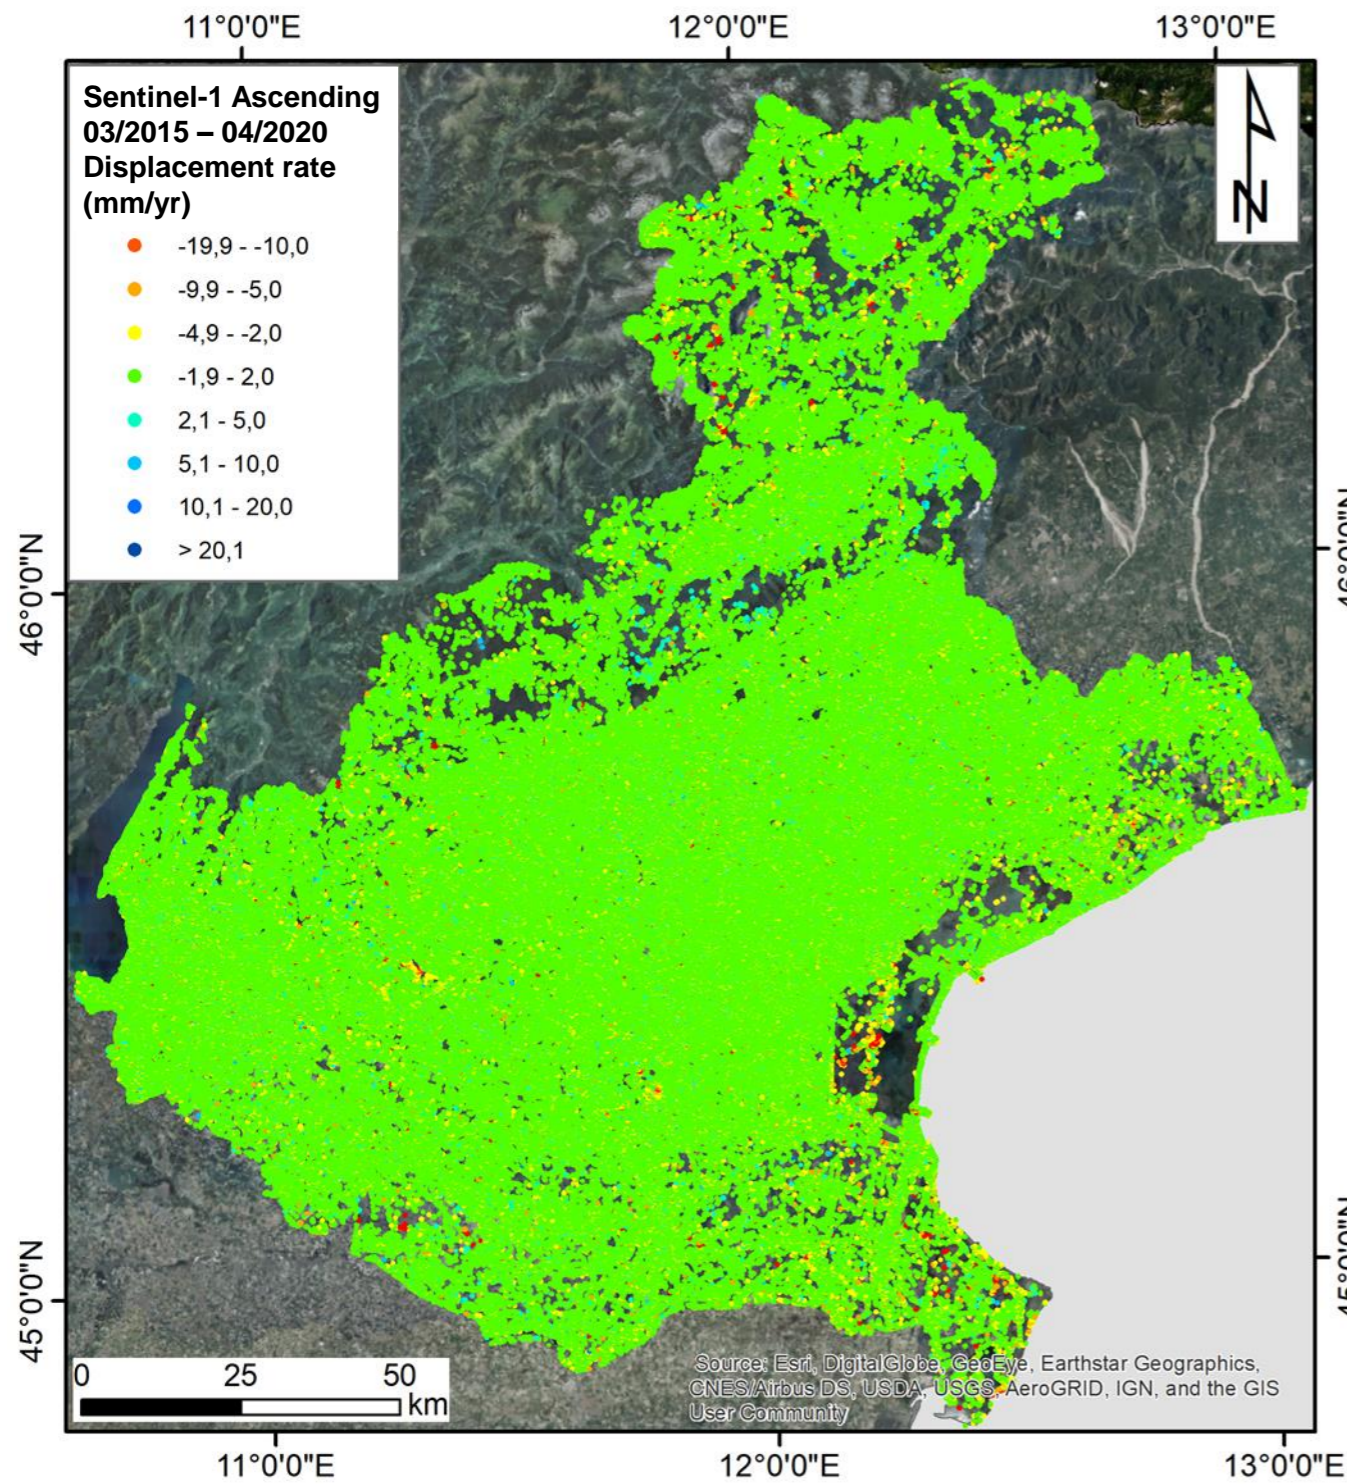

Mt. Rotolon landslide

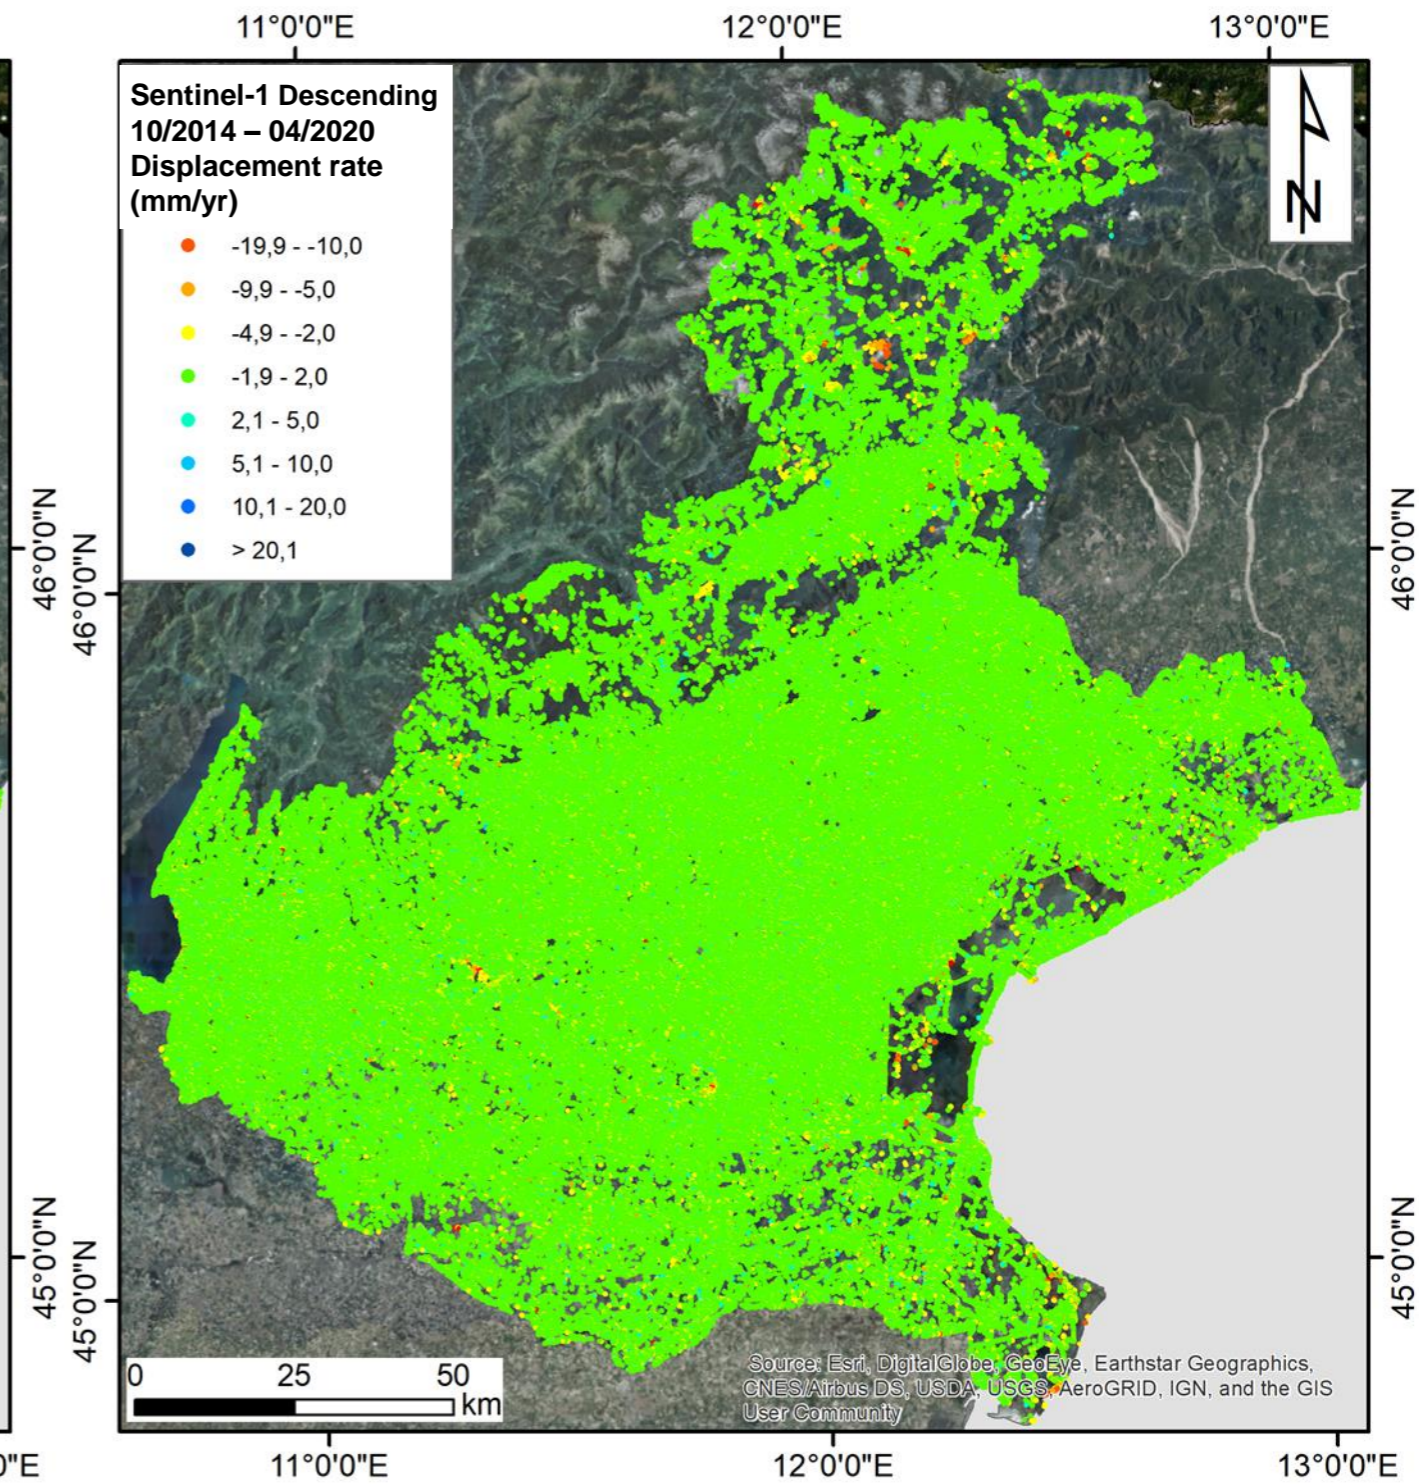

Slides, flows, complex
landslides, DSGSDs

- About 4400 mapped landslides (IFFI)
- Extensive subsidence areas
- Karst landscape

Sentinel-1 data

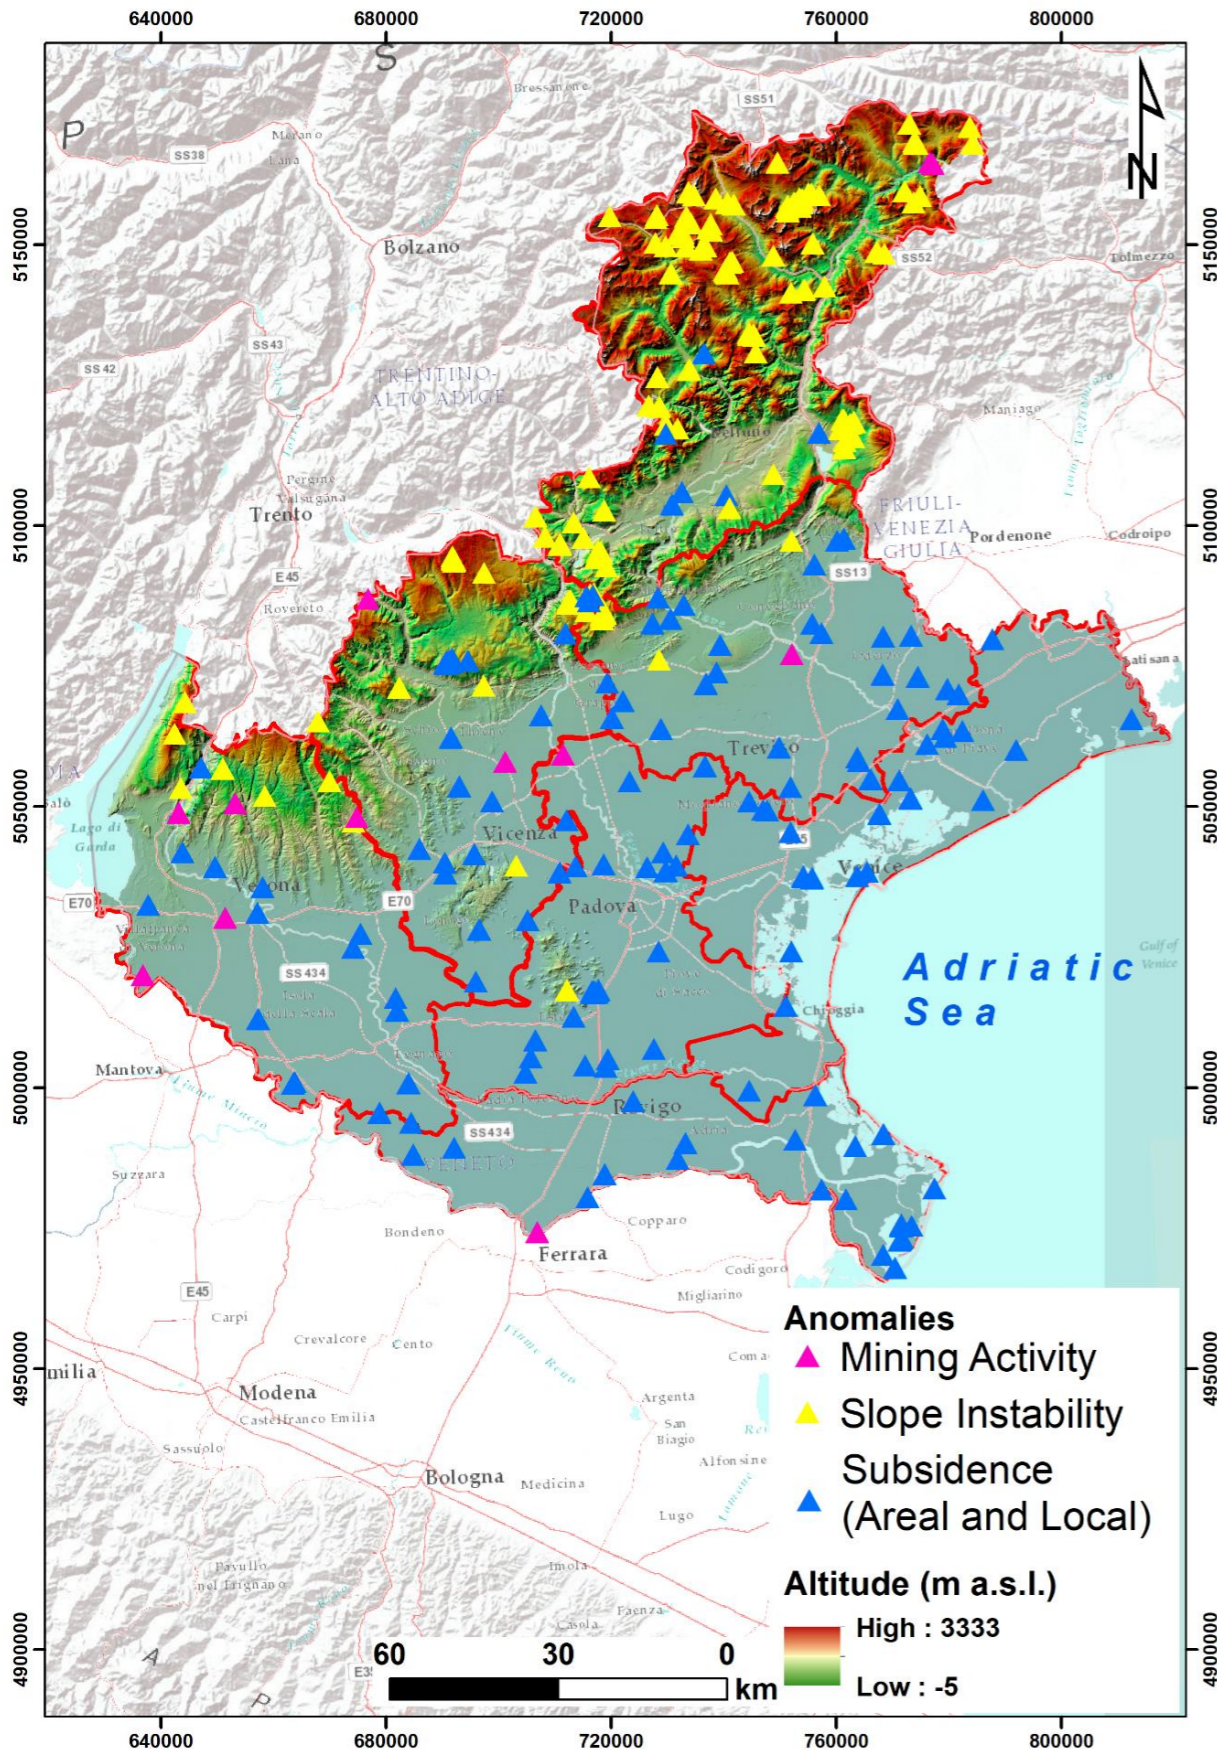

Ascending geometry
03/2015 – 04/2020

Descending geometry
10/2014 – 04/2020

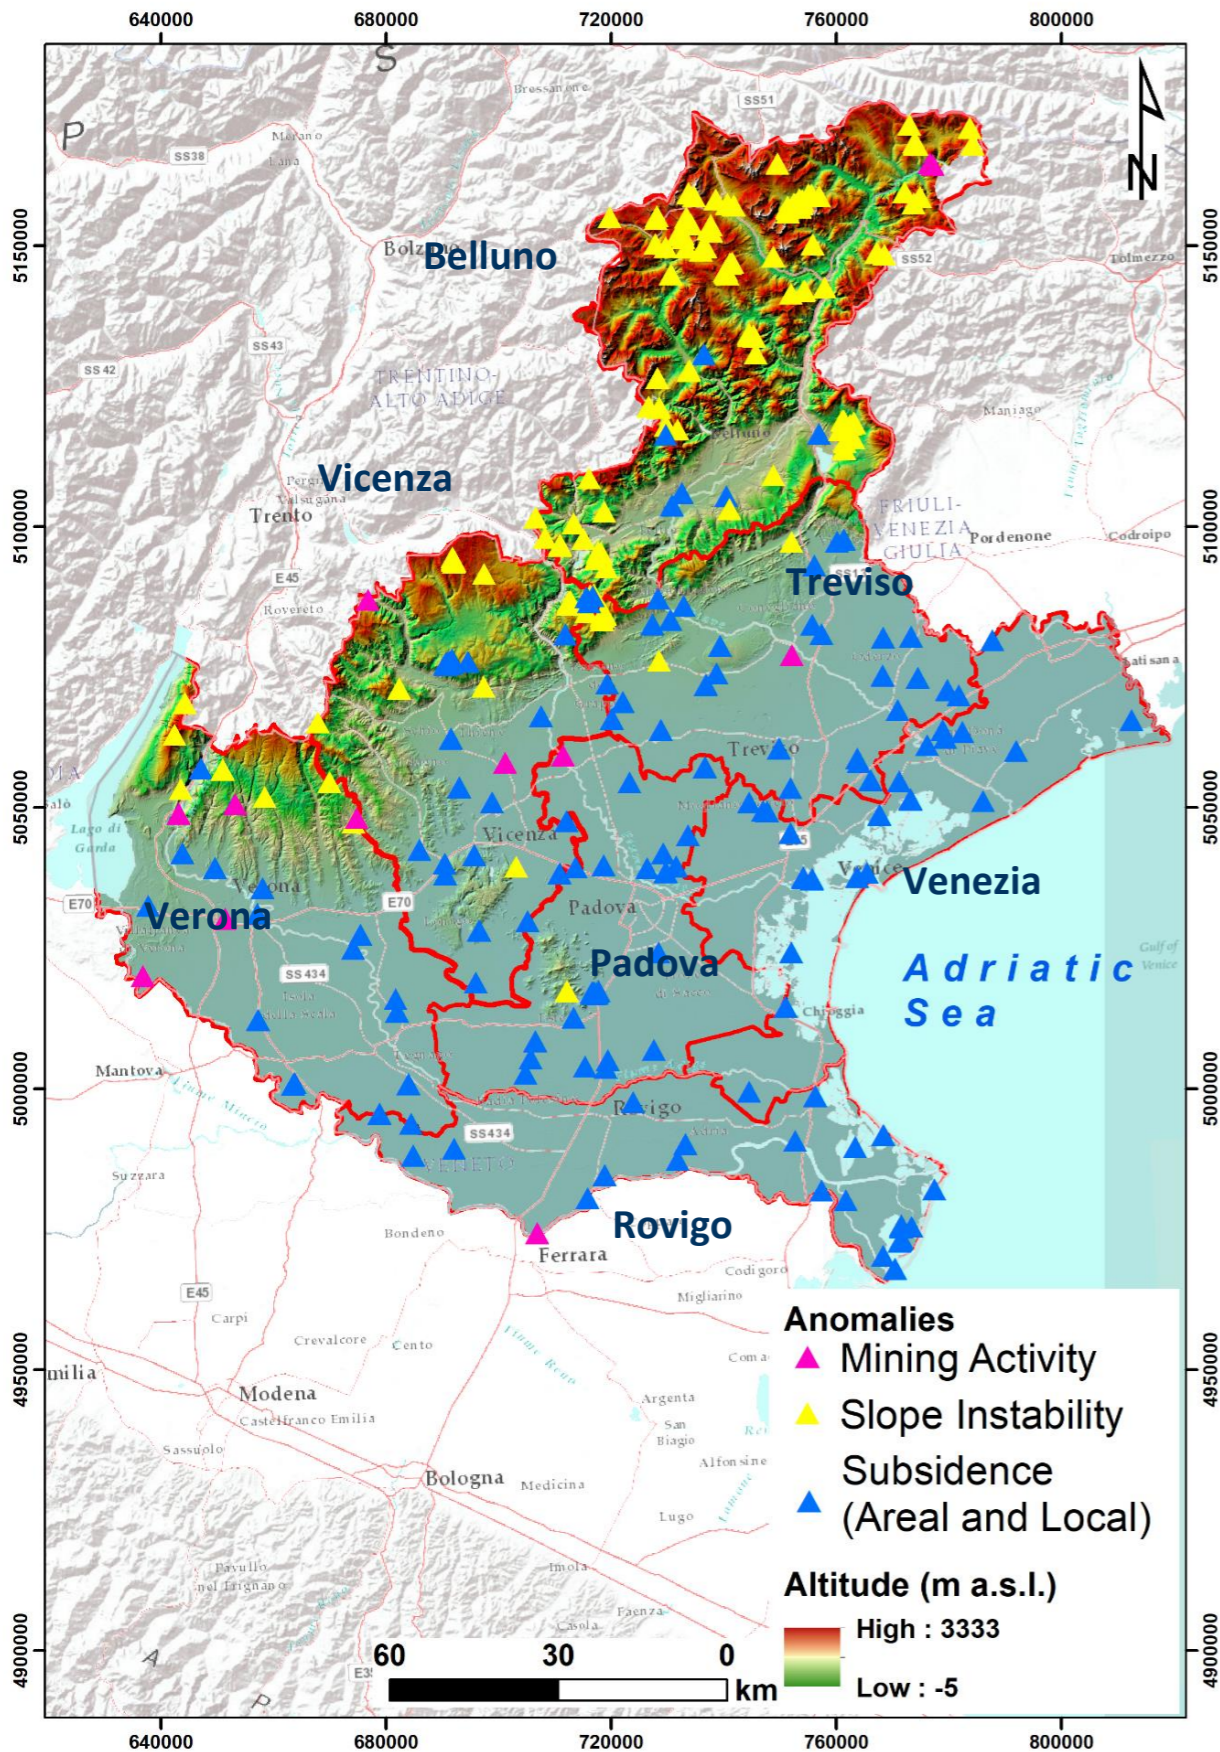

PS monitoring – Anomalies

Cause	n.
Mining Activity	68
Slope Instability	1299
Subsidence (Areal and Local)	1221

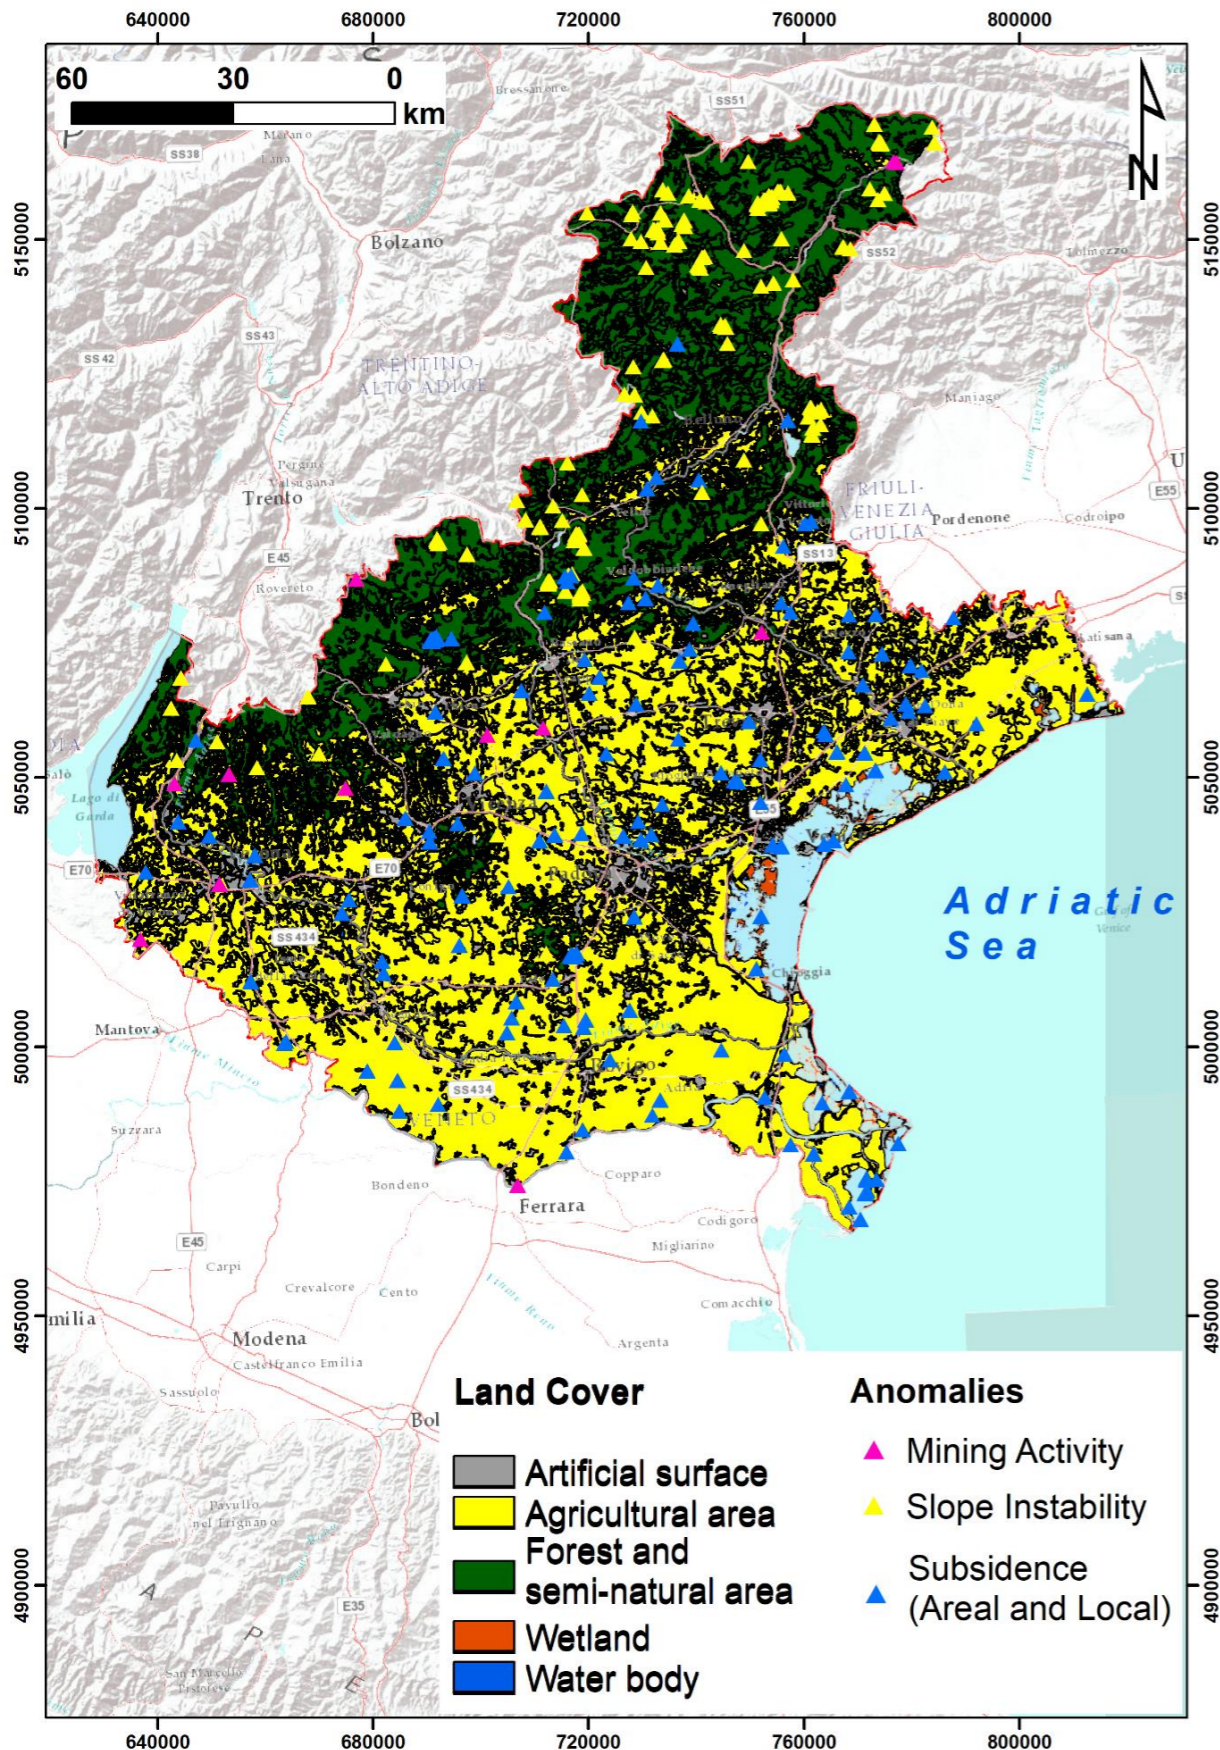

PS monitoring – Anomalies

Province	SI	S	MA
Belluno	94%	4%	2%
Vicenza	26%	72%	2%
Treviso	21%	77%	2%
Verona	21%	62%	17%
Padova	13%	85%	2%
Venezia	0%	100%	0%
Rovigo	0%	98%	2%

PS monitoring – Anomalies

Land cover distribution

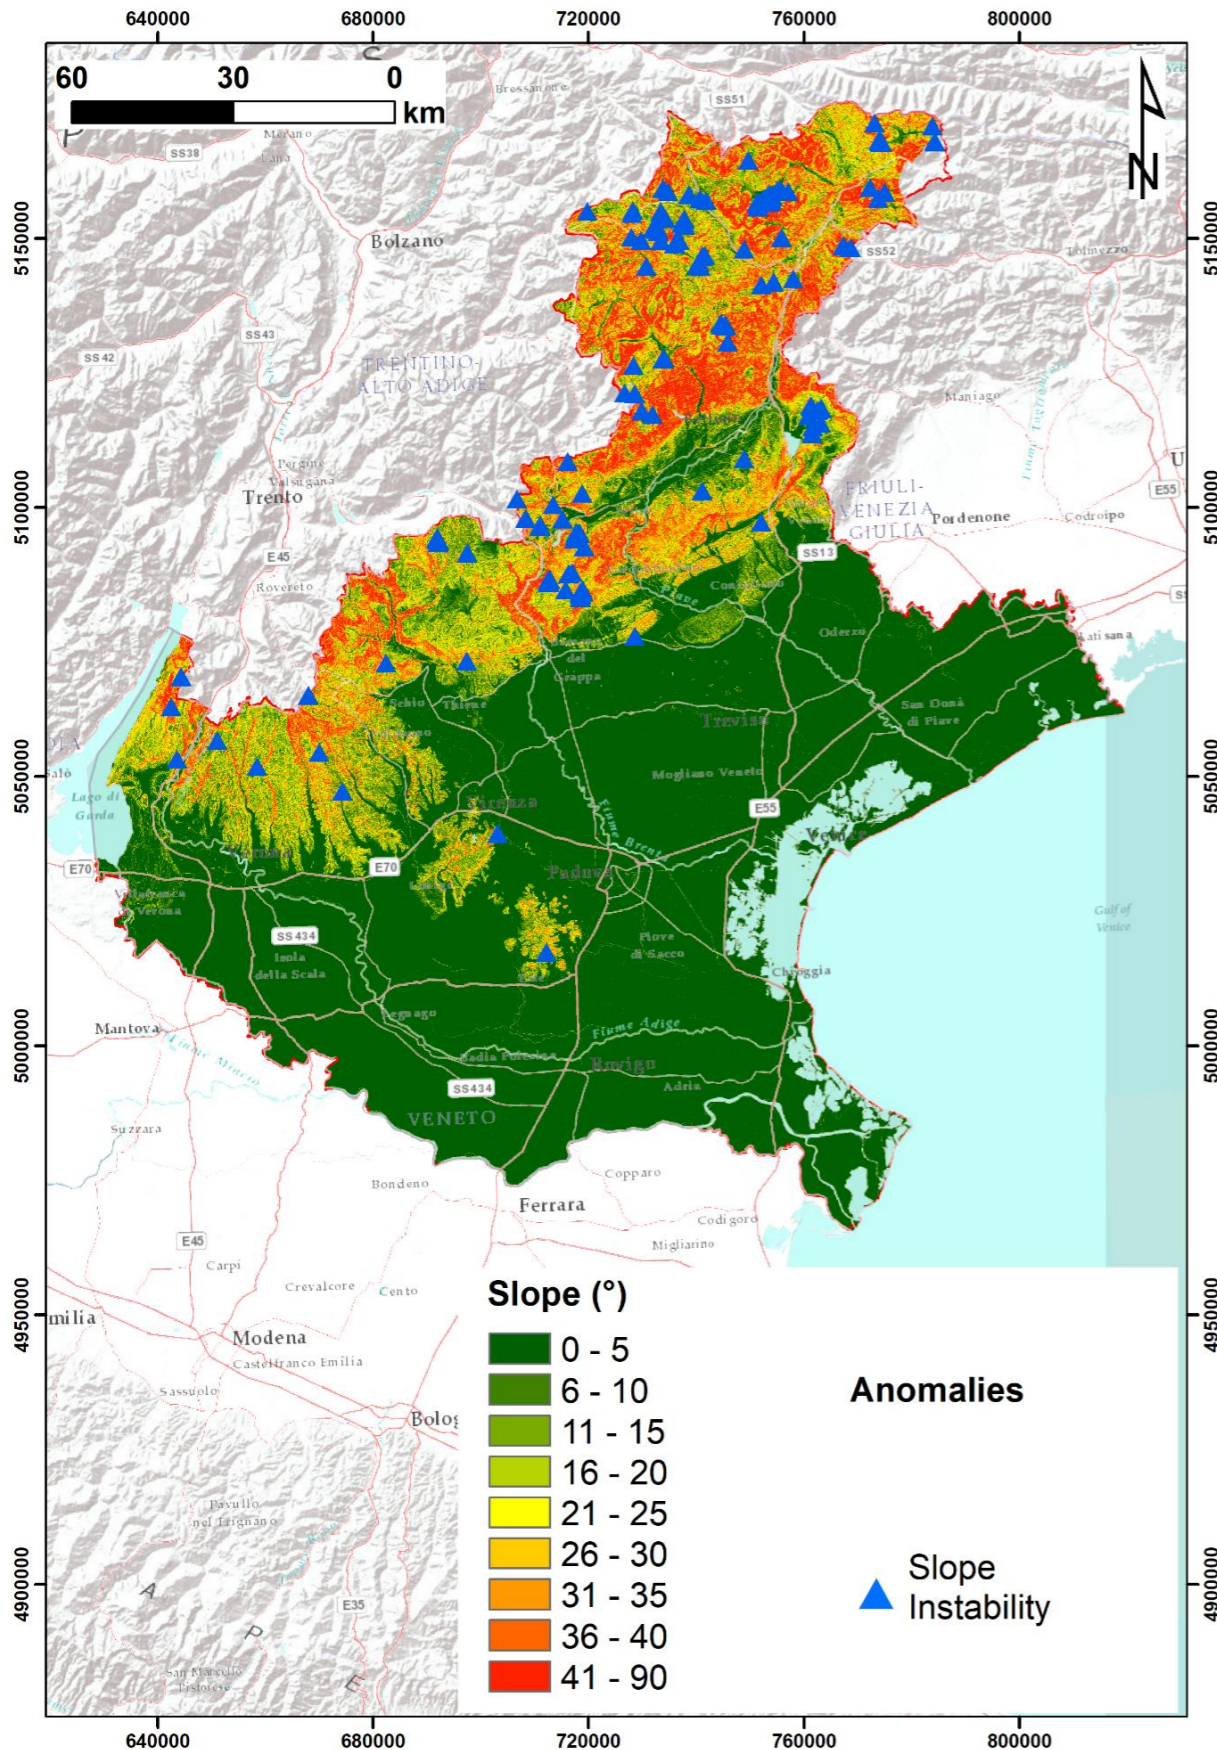

Cause	n.
Artificial surface	141
Agricultural area	877
Forest and semi-natural area	1484
Wetland	12
Water body	51

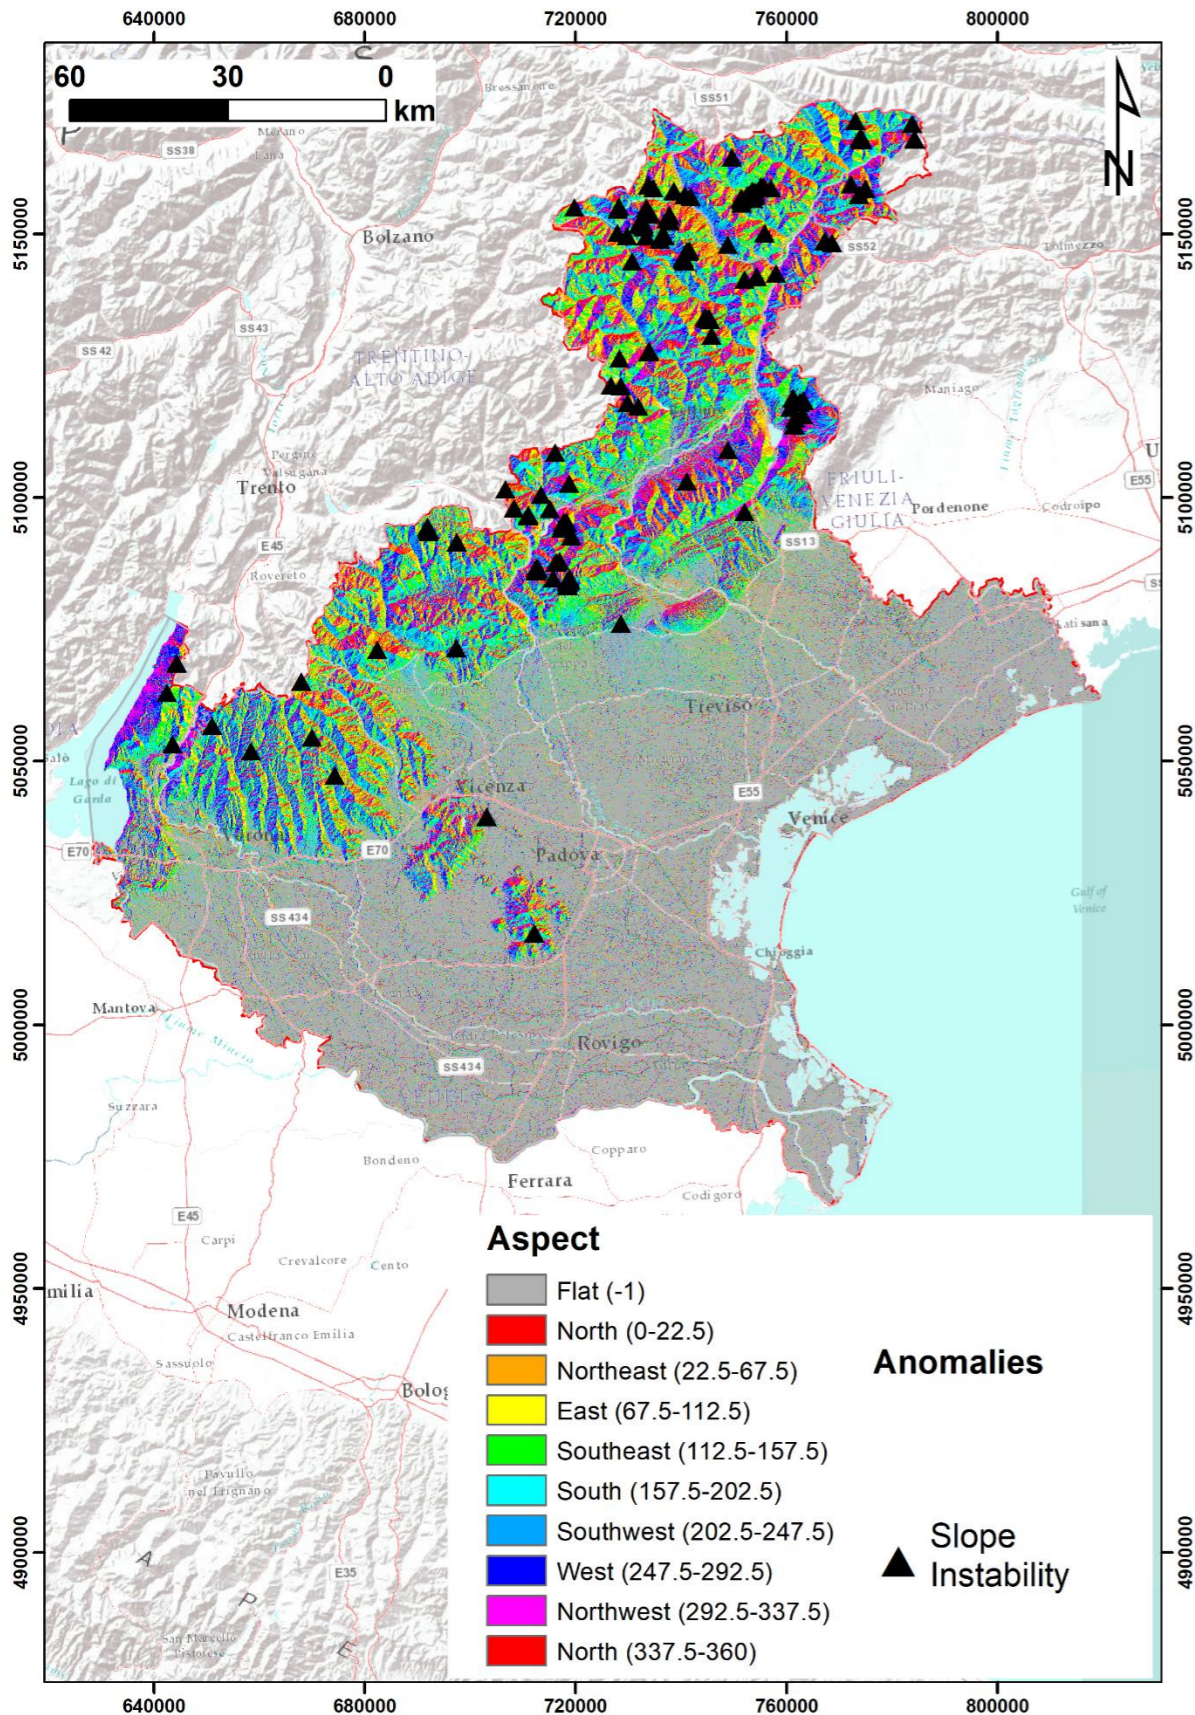

PS monitoring – Anomalies

Slope angle distribution

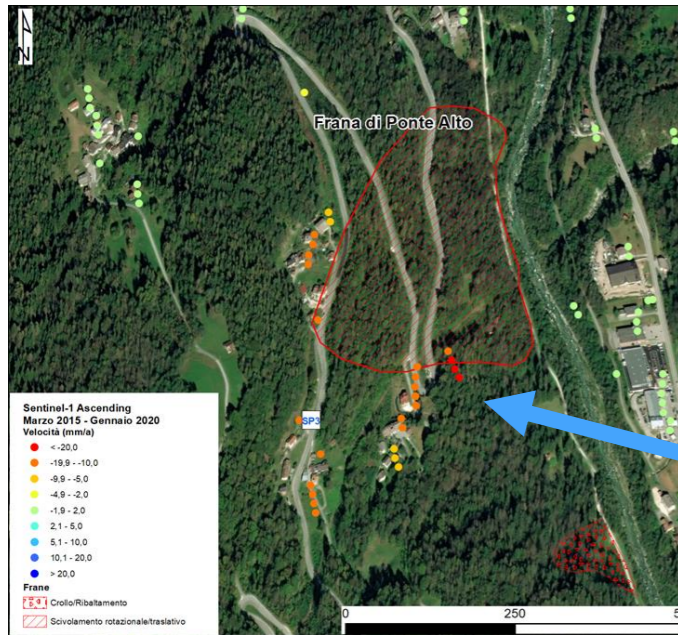

PS monitoring – Anomalies

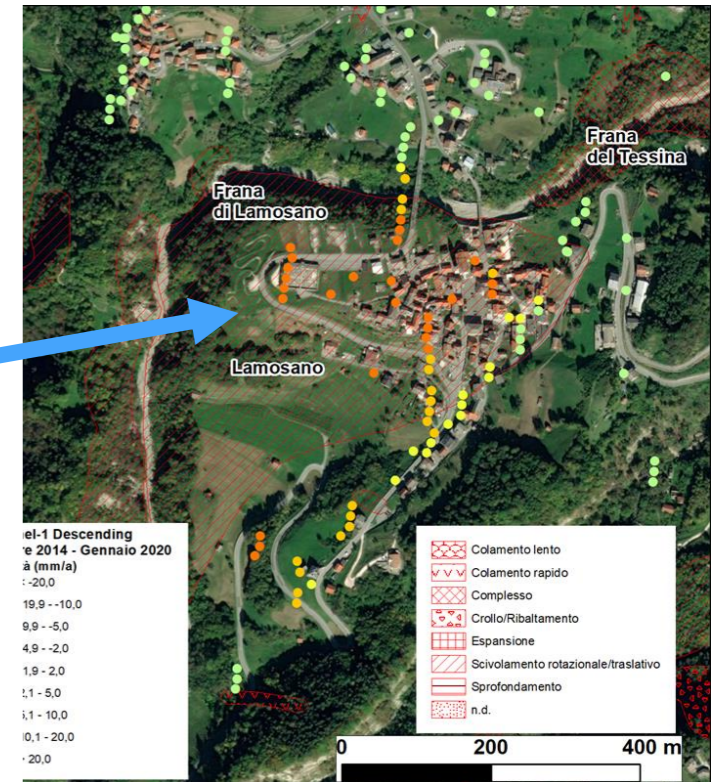

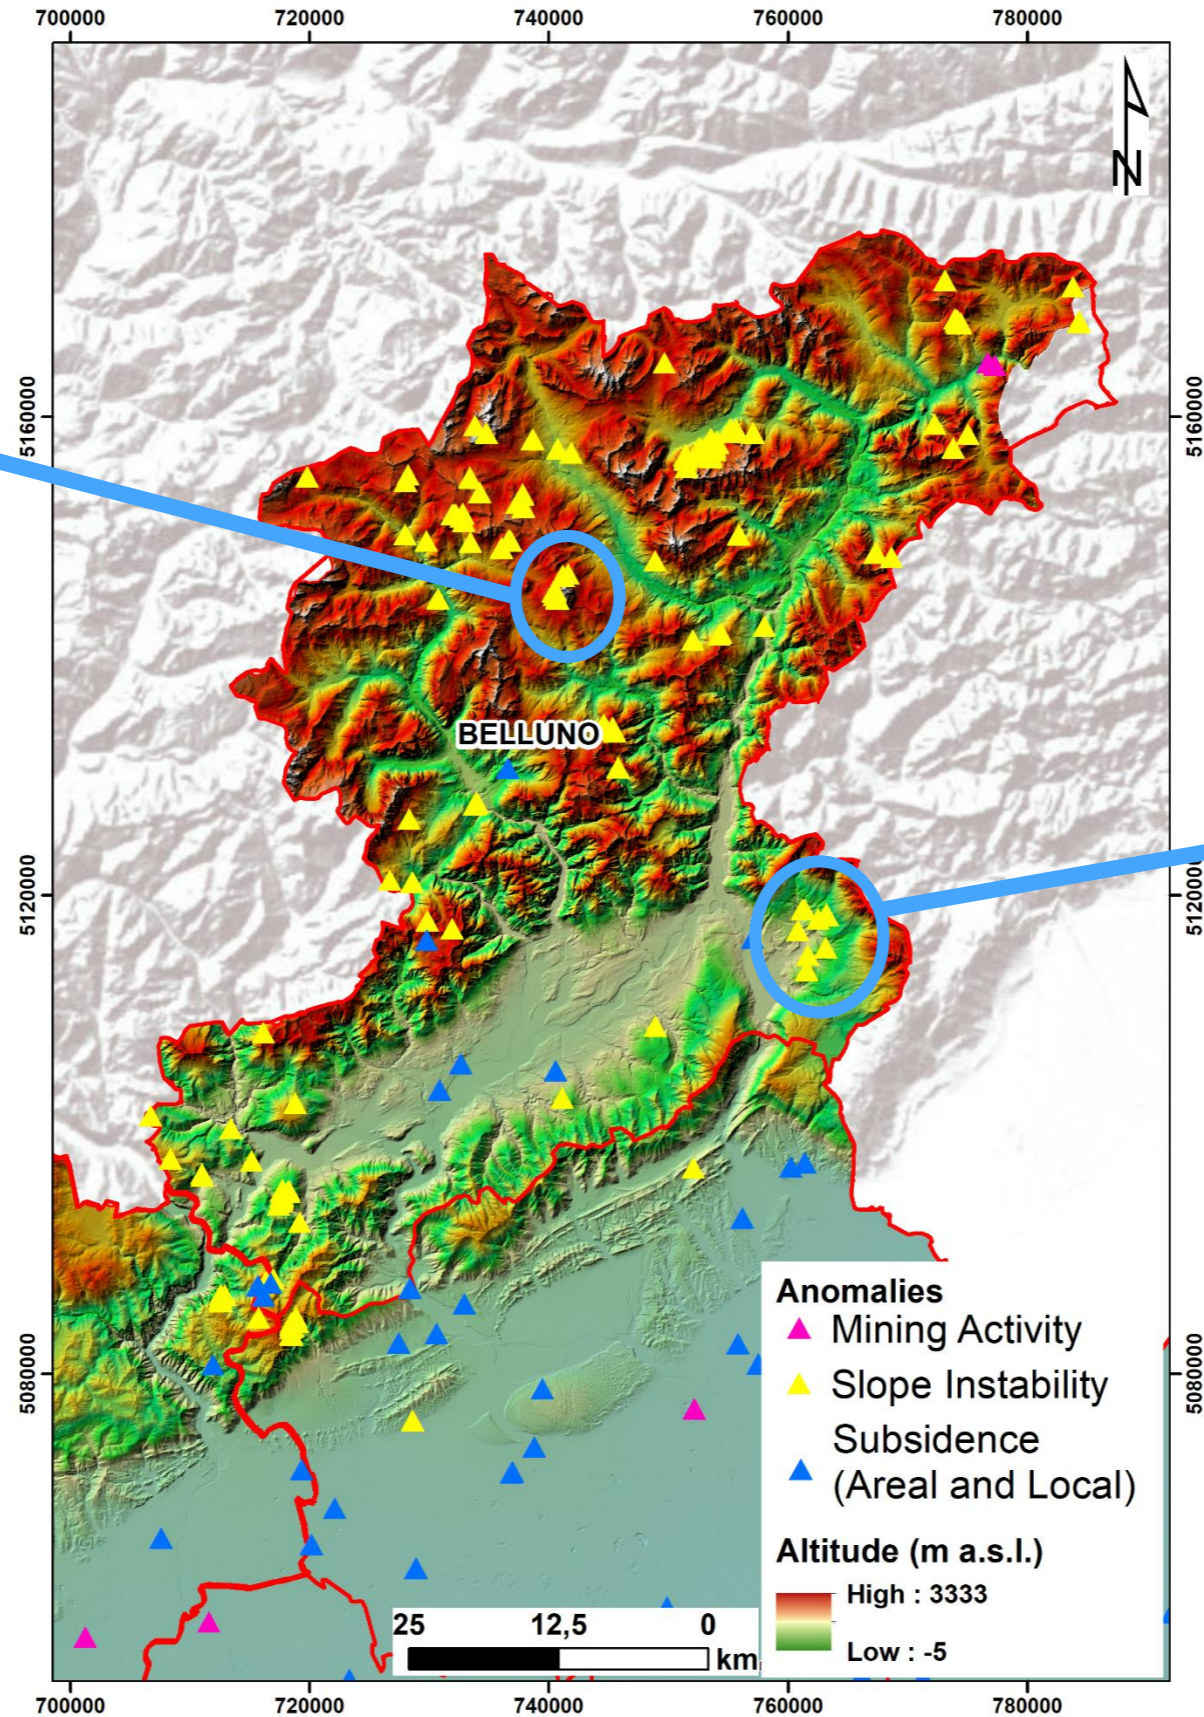

Aspect angle distribution

PS monitoring – Alerts

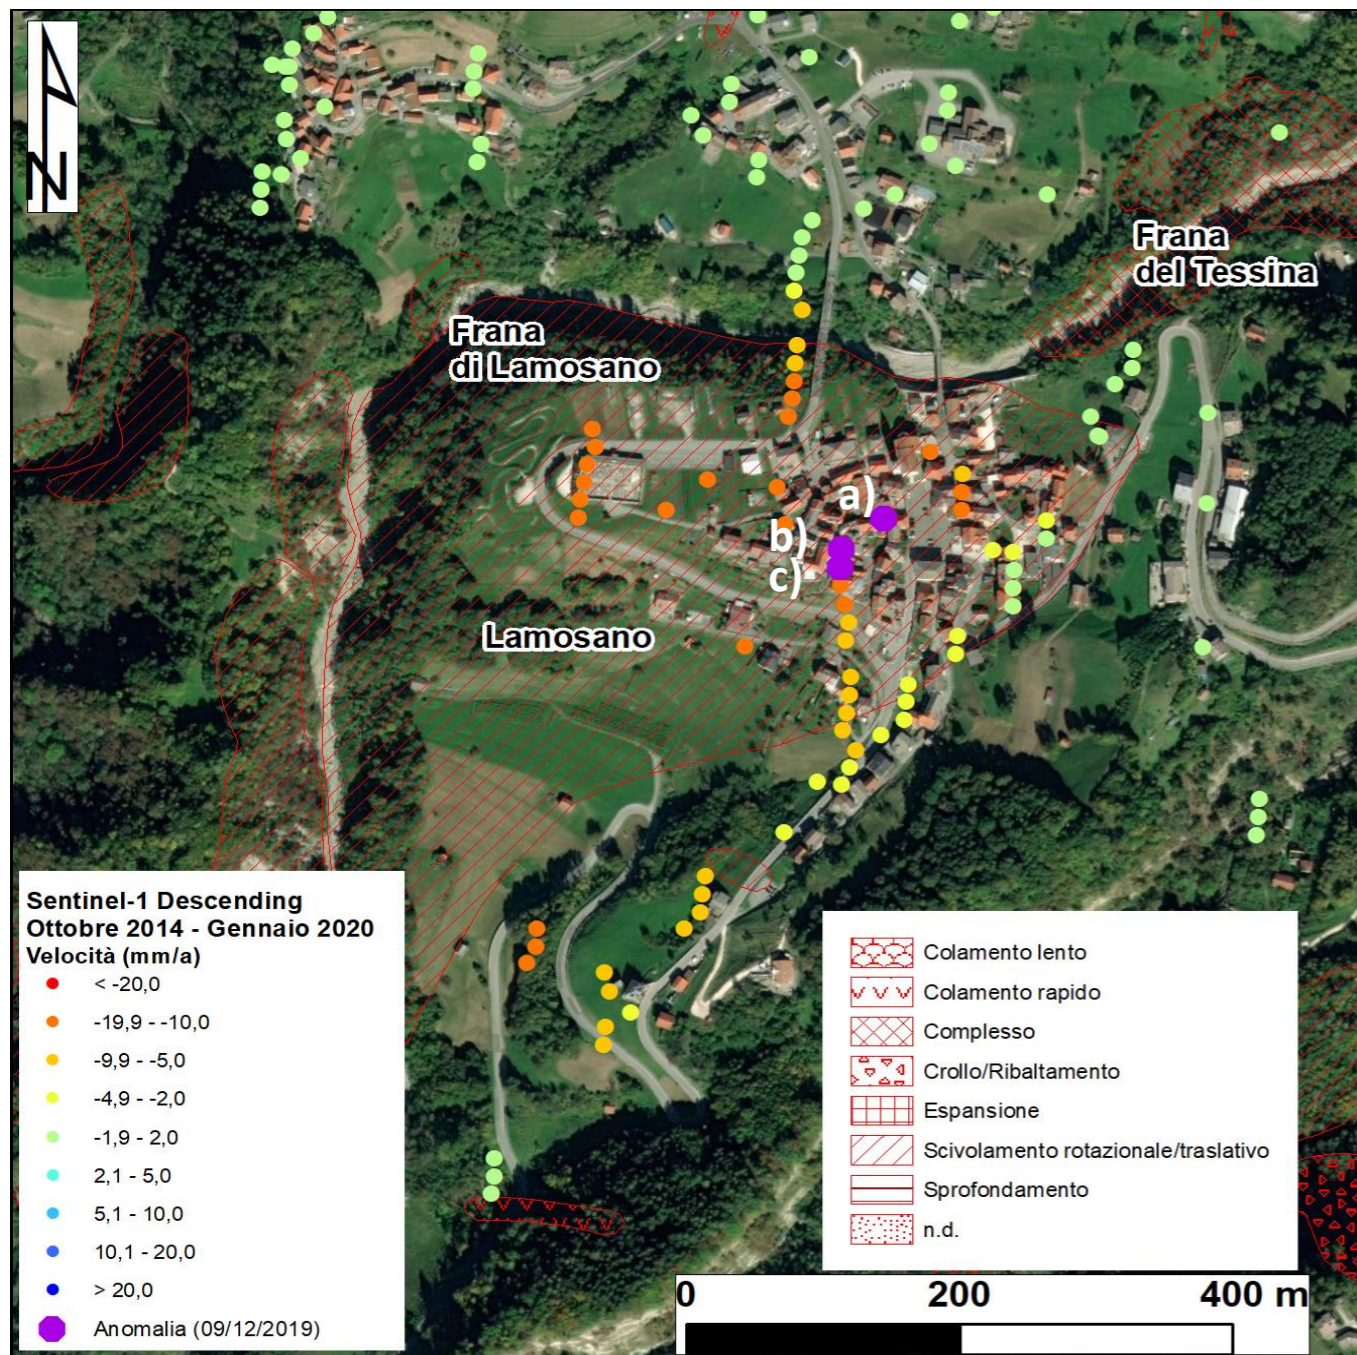

*Rivamonte
Agordino*

Lamosano

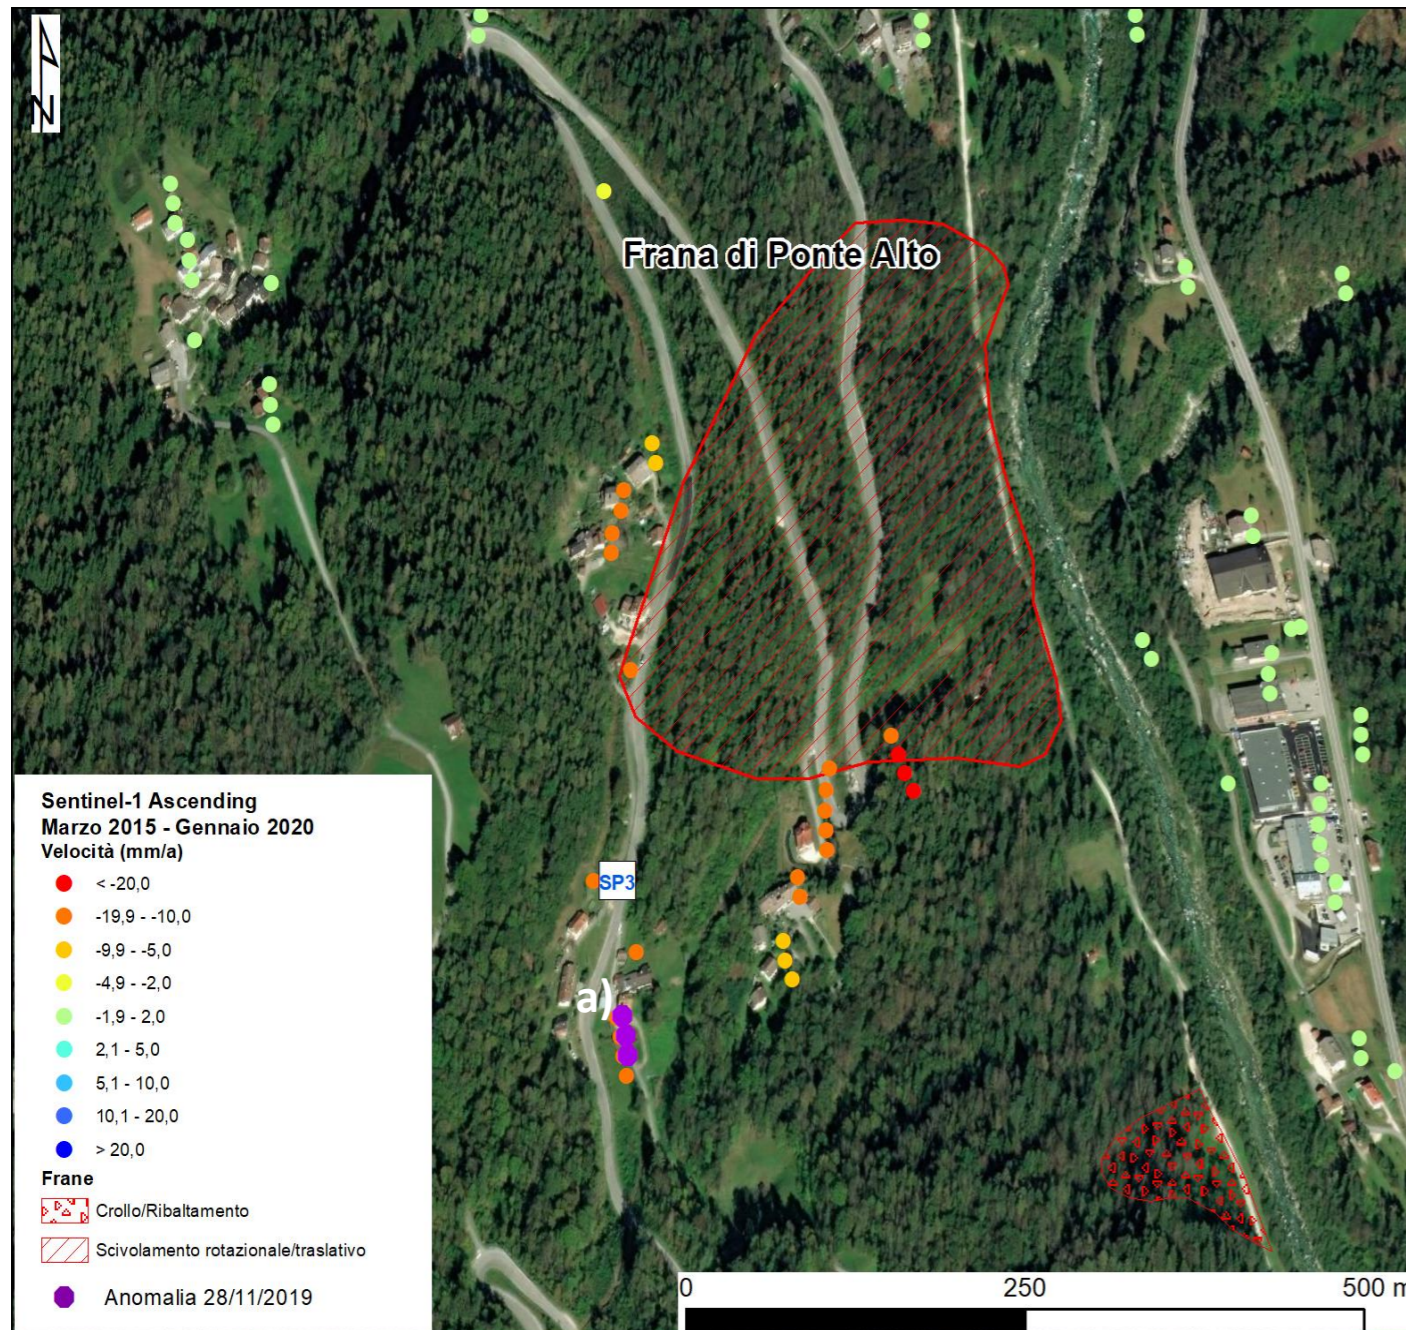

PS monitoring – Alerts

Lamosano

PS monitoring – Alerts

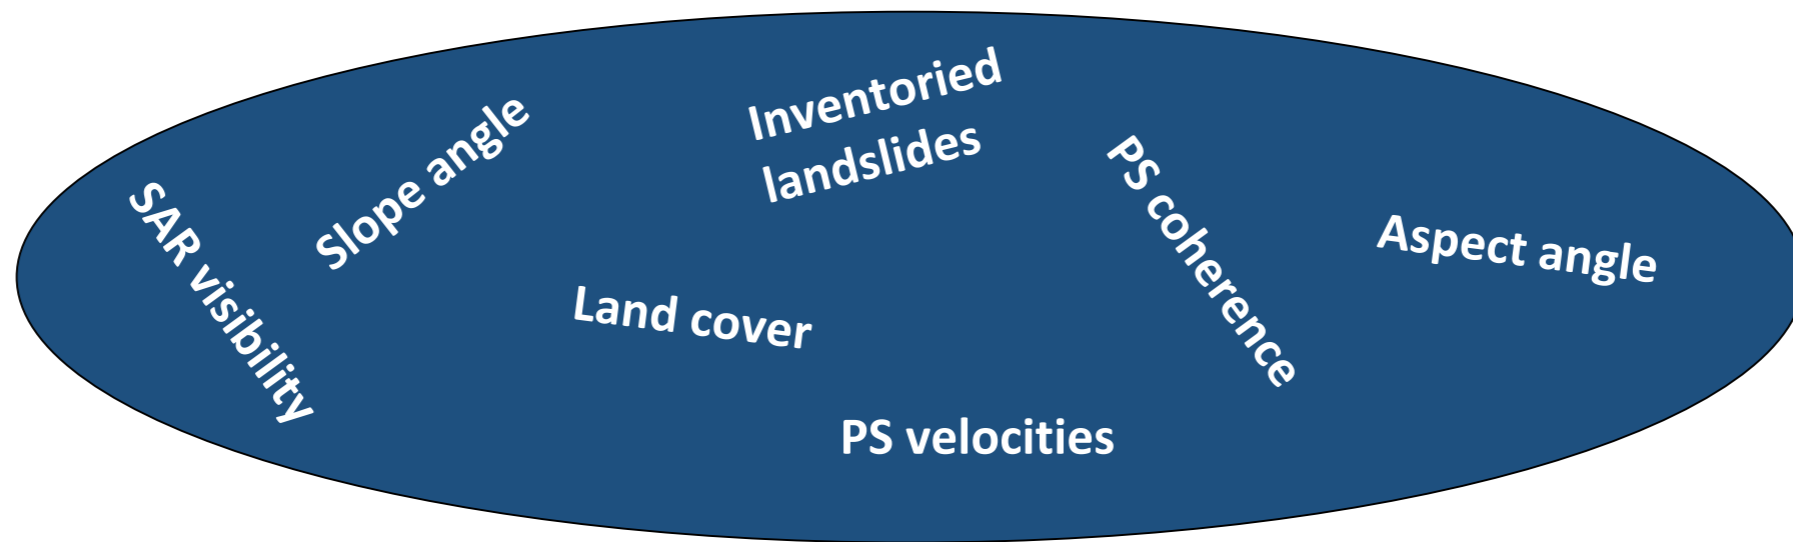

*Rivamonte
Agordino*

Conclusions

- Time-series analysis is a valuable tool to promptly detect the so-called anomalies of movement, i.e. those areas showing a trend variation (e.g. acceleration), needing further on-site investigations.
- The monitoring system is a «real time» operational tool capable of providing the continuous update and warning of critical issues, giving useful indications to territorial planning and risk management activities.

Future perspective

Analysis of anomalies distribution

Spatial forecasting of anomalies occurrence?
