European Geoscience Union 2020 : Sharing Geoscience Online - May 5, 2020
Session TS5.3 - The Mechanics of Earthquake Faulting: a multiscale approach
Mirror Slip Surfaces

- Highly reflective fault mirrors are widely observed in tectonically active carbonate terrains

- ‘Shinny’ or ‘Mirror like’ Slip Surfaces (MSS) have been experimentally produced at both seismic (v ≥ 10^{-4} ms^{-1}) and sub seismic slip velocities (v < 10^{-4} ms^{-1})

- MSS produced at seismic slip velocities at a range of normal stress (σ_{n,eff} = 0.9 – 28.4 MPa) (Siman-Tov et al., 2015; Green II et al., 2015)

- Role of normal stress at sub seismic velocities yet to be investigated

- MSS produced at seismic and sub seismic velocities are internally composed of nanogranular material (Siman-Tov et al., 2013; Verberne et al., 2014)

**Aim**

- Investigate the effect of normal stress (σ_{n,eff}) & cumulative displacement (Σx) on MSS development at sub seismic slip velocities

- Are there distinguishing characteristics between MSS produced at sub seismic and seismic slip velocities
  -> Can natural MSS be used to identify paeloseismic slip?

- Investigate whether MSS can be reproduced under the same conditions with different deformation apparatuses
# Method

## Experimental set up

- Calcite fault gouge (d = 12-15 μm)
- Argo gas Triaxial Deformation Apparatus with a saw cut assembly
- Rotary Shear Apparatus
- All experiments performed at room dry conditions and room temperature
- Microstructural analysis – visual inspection, light microscopy and SEM
- Raman spectroscopy

## Triaxial Deformation Apparatus

- MSS exposed along boundary shear between driver block and gouge
- Areal extent of the MSS systematically increases with displacement
- The displacement after which MSS develop rapidly decreases as confining pressure (normal stress) is increased

MSS Area [%] = \frac{\text{Area of MSS}}{\text{Area of Sample recovered}} \times 100

- Patchy = MSS Area <80%
- Continuous = MSS Area >80%

Photograph of MSS:
- \( P_c = 30 \text{ MPa} \)
- \( \sigma_n^{\text{eff}} = 52 \text{ MPa} \)
- \( v = 10^{-6} \text{ ms}^{-1} \)
- \( \Sigma x = 6.16 \text{ mm} \)
Results – MSS (Rotary)

- MSS exposed along the boundary shear between the sample and lower driver block
- MSS observed at \( v = 10^{-6} \) & \( 10^{-5} \) ms\(^{-1} \) but not at \( v = 10^{-4} \) & \( 10^{-3} \) ms\(^{-1} \)
- MSS reappear at seismic slip velocities (\( v = 1.2 \) ms\(^{-1} \))
- Unlike in the triaxial experiments MSS were not observed after 6 mm of displacement at \( v = 10^{-6} \) ms\(^{-1} \) and \( \sigma_{n}^{\text{eff}} = 10 \) MPa

Photograph of MSS exposed on lower driver block:
- Patchy = MSS Area <80%
- Continuous = MSS Area >80%

\[ \sigma_{n}^{\text{eff}} = 10 \text{ MPa} \]
\[ v = 10^{-6} \text{ ms}^{-1} \]
\[ \Sigma x = 42.67 \text{ mm} \]
MSS produced at seismic and sub-seismic slip velocities are internally composed of rounded nanospherules (d≈100nm).

Nanospherules sinter to form low porosity MSS.

Holes in the MSS expose the more porous shear band below the MSS which is also composed of nanospherules.

MSS produced at sub-seismic velocities, low normal stresses and high displacements display poor sintering and a noticeably higher porosity.

MSS produced at seismic velocities display a remarkably lower porosity and more enhanced sintering.

**Triaxial deformation apparatus**

- $P_c = 30$ MPa ($\sigma_n^{\text{eff}} = 54$ MPa), $v = 10^{-6}$ ms$^{-1}$, $\Sigma x = 3.98$ mm
- $P_c = 18$ MPa ($\sigma_n^{\text{eff}} = 32$ MPa), $v = 10^{-6}$ ms$^{-1}$, $\Sigma x = 6.25$ mm
- $\sigma_n^{\text{eff}} = 10$ MPa, $v = 10^{-6}$ ms$^{-1}$, $\Sigma x = 42.67$ mm

**Rotary shear apparatus**

- $\sigma_n^{\text{eff}} = 10$ MPa, $v = 1.2$ ms$^{-1}$, $\Sigma x = 453.98$ mm
Nanofibers

Nanofibrous structures observed in:
Triaxial experiments performed at $10^{-6}$ ms$^{-1}$ at $\sigma_{n}^{\text{eff}} \approx 50$ MPa & 170 MP
Rotary shear experiments performed $10^{-5}$ ms$^{-1}$ at $\sigma_{n}^{\text{eff}} = 10$ MPa

- Nanofibers connect individual nanospherules produced a ‘stick-and-ball’ structure.
- Individual nanofibers observed in fractures in the MSS and within the MSS
- In the experiments performed at high normal stress ($\sigma_{n}^{\text{eff}} \approx 170$ MP) nanofibrous films composed aligned nanofibers were also observed which align with the slip direction

$P_c = 30$ MPa ($\sigma_{n}^{\text{eff}} = 54$ MPa)  
$\nu = 10^{-6}$ ms$^{-1}$  
$\Sigma x = 3.98$ mm

$P_c = 100$ MPa ($\sigma_{n}^{\text{eff}} = 160$ MPa)  
$\nu = 10^{-6}$ ms$^{-1}$  
$\Sigma x = 5.95$ mm
- MSS produced at sub seismic and seismic slip velocities composed of crystalline calcite

- Patches of Amorphous Carbon observed on MSS produced in all experiments performed at $v = 10^{-6}$ ms$^{-1}$, $P_c = 100$ MPa ($\sigma_{n}^{\text{eff}} \approx 170$ MPa)

- No measured macroscopic temperature rise at $v = 10^{-6}$ ms$^{-1}$

- Patch/ fragments of Amorphous Carbon on top of MSS produced at $v = 1.2$ ms$^{-1}$, $\sigma_{n}^{\text{eff}} = 10$ MPa, $\Sigma x = 453.98$ mm

$v = 10^{-6}$ ms$^{-1}$, $P_c = 100$ MPa ($\sigma_{n}^{\text{eff}} = 166$ MPa), $\Sigma x = 2.61$ mm

$v = 1.2$ ms$^{-1}$, $\sigma_{n}^{\text{eff}} = 10$ MPa, $\Sigma x = 453.98$ mm
Summary

- Continuous MSS were produced (>80% of sample is MSS) at both seismic and sub seismic velocities
- MSS are low porosity layers composed of rounded nanospherules
- MSS Area systematically increases with displacement at sub seismic slip velocities ($v = 10^{-6} \text{ ms}^{-1}$)
- At sub seismic slip velocities the displacement after which MSS develop rapidly decreases as normal stress is increased
- MSS are not observed at intermediate velocities ($v = 10^{-4} – 10^{-3} \text{ ms}^{-1}$)
- Our results demonstrate that continuous MSS can be produced at both seismic and sub seismic slip velocities and share similar microstructural characteristics so they cannot be used as reliable indicators of paeloearthquake slip

$$W = \tau \cdot v$$

$W =$ Mechanical power density [W/m$^2$] $\tau =$ peak shear stress [MPa] $v =$ slip velocity [ms$^{-1}$] (Fondriest et al., 2013)
