1. Introduction

- **Geosites**: geological and geomorphological features with scientific, cultural, aesthetic and/or economic values (Reynard, 2004).

- **Geotourism**: experiencing geosites (Dowling, 2013)

- Geosites are the main attractions for geotourism.

- Inventory and assessment-necessary (Suzuki & Takagi, 2018).
2. Problem statement and objective

Ethiopia:

• Rich spectacular geosites.
• But, undervalued (Williams, 2020).
• Lack of systematic geoheritage evaluation strategy & efforts to promote potential geosites as geotourism destinations (Asrat, 2018).

2. Problem ... cont’d

• There are few studies on geotourism in Ethiopia.

The number of specialists' published journal articles on geotourism in 2012–2014 per countries of affiliations (Ruban, 2015, p. 11)

• The objective of our study is to inventory and assess geosites for geotourism development in the southeastern Lake Tana area, northwestern Ethiopia.
3. The study area

- The study area is strategically located in one of the major tourist routes in Ethiopia.

Map of Ethiopia's northern historic tourist route (source: Kimkim\(^a\))

Geological map of the Lake Tana area (Williams, 2016, p.123)
3. The study area ... cont’d

- The study area has two very important waterbodies, Lake Tana and Blue Nile River, with a potential to geotourism development.

**Lake Tana and its (island) monasteries**

- Lake Tana is the largest lake (ca. 3100 sq.km) in Ethiopia, and source of the Blue Nile River.
- It has ca. 35 islands housing ca. 20 monasteries and churches, some dating back to the 13\textsuperscript{th} & 14\textsuperscript{th} centuries (Phillips and Carillet, 2009).
- The majority of the Lake Tana islands are formed of blocky lava fragments or are cinder cones (Williams, 2016).
- The lake and its islands are part of the UNESCO registered Lake Tana Biosphere Reserve.

3. The study area ... cont’d

The Blue Nile River

• The longest river in Ethiopia (900km)
• Has the deepest (with 1600 m) and most extensive canyon in the entire Nile Basin (Firew, 2014).
• The most important water body in northeast Africa (Firew, 2014).
• Egypt is ‘the Gift of the Nile” (Herodotus)
• Blue Nile River contributes 56% of water for the Nile (Habteyes et al., 2015).

Quest for the source of the Nile

“The source of the Nile was a quest that interested philosophers, emperors and geographers alike”.

- Herodotus
- Ptolemy
- Alexander the Great
- Julius Caesar
- Emperor Nero
- Pedro Paez
- James Bruce

““It was the thing Julius Caesar most coveted to know in the world ... he would quit his country Rome for the satisfaction of discovering that source”

- Emperor Nero sent two centurions to discover the source, but they failed.

- Pedro Paez (Portuguese Jesuit priest) - the first European to visit and document the source of the Blue Nile 1618.

(Oestigaard and Firew, 2013)

4. Methodology

1. Literature review and expert consultation + satellite images
2. List of potential geosites
3. Fieldwork
4. List of geosites and characterization
5. Quantitative assessment

Methodology for inventory and assessment of geosites (based on Brilha, 2016)

*a* detail in the next slide (slide 15)
4. Methodology ... cont’d

Quantitative assessment methodology

The quantitative assessment criteria, indicators and sub-indicators were developed based on a review of publications on the field.

• Two major groups of values (criteria) are used to assess geosites: main and additional.
  ➢ Main value consists of five indicators: scientific, educational, scenic, recreational and protection which are further subdivided into twelve sub-indicators.
  ➢ Additional value has two indicators (added and functional) which consist of six sub-indicators.
5 Inventory and assessment results

A first list of 120 geosites inventoried. The major geosites include:

- Waterfalls
- A lake with islands and island monasteries
- Hot springs
- A flood plain
- Caves and cave churches
- Lava tubes
- A mountain (shield volcano)
- Volcanic plugs
- Volcanic cones
- Volcanic columns
- Rock-hewn churches
- Viewpoints

5 Inventory and assessment ... cont’d

• The 120 inventoried geosites:
  • screened by qualitative criteria (safety, accessibility, uniqueness)
  • clustered

and finally,

- 44 geosites with and without viewpoints and
- 17 viewpoints

were selected for further assessment.
Location of the selected geosites in the southeastern Lake Tana region (Tessema et al., subm.)
5 Inventory and assessment ... cont’d

Values

- SCI = scientific value
- EDU = educational value,
- SCE = scenic value
- REC = recreational value
- PRO = protection value
- ADD = added value
- FUN = functional value

NB: the assessments were for geosites with and without viewpoints only, and not for viewpoints

6 Concluding remarks

• Inventory and assessment of geosites is a prerequisite for geotourism development for a given destination.
• Geosites of the study area have a significant potential for geotourism development.
• The geosites differ in size, ranging from single points such as hot springs to complex areas such as Lake Tana and Mt Guna.
• Complex area geosites received relatively higher scientific, scenic and recreational value scores.
• Besides, most geosites have a higher main value score than additional value.
• Lake Tana and its island monasteries, Blue Nile Falls and Canyons, Fogera plain and Zegie peninsula are among the geosites with the highest geotourism potential.
6 Concluding remarks

- Critical socioeconomic development needs in the study area include reducing poverty, achieving food security, transforming rural livelihoods and income, reversing land degradation, conserving natural resources, and reducing sedimentation of the Lake and dams (Goshu et al., 2017).
- The development of geotourism in the study area can play its part in tackling these problems and support sustainable development.
