# Energy micropiles

Dual function:

1. **Mechanical**
2. **Thermal**

**Innovative application**

- **Structural retrofitting**
  - **Energy retrofitting**
- of existing buildings

|                      |                                  |
|----------------------|----------------------------------|
| Materials            | Concrete and steel               |
| Typical dimensions   | Lmax= 10-20 m<br>Dmax= 0.2-0.3 m |
| Heat exchanger pipes | A single HDPE/HDPP U-loop        |
| Heat exchanger fluid | HFC (water + antifreeze)         |
| Installation         | Cast in place                    |

Ronchi et al., 2018

## Problem formulation

### Heat exchange processes

- Convective exchange between fluid and pipe walls
- Conduction through pipe material, steel and concrete
- Conduction through soil surrounding the pile.

## Aims

### Simulate thermal operational conditions of energy micropiles

- Long- and short- term performance
- Influence of design parameters
- Comparison with performance of standard energy piles

1. Pile geometry
2. Material thermal parameters
3. Fluid velocity

# Numerical model

## 3D FEM model of single micropile

- Cylindrical domain  $D=20\text{m}$ ,  $H=30\text{m}$
- Homogeneous fine-grained soil
- Pipes represented as linear elements for computational economy
- Model created with COMSOL Multiphysics

Overview

# Parametric analysis

## PARAMETER SELECTION

- Pile length,  $L_P$ ;
- Pile diameter,  $D_P$ ;
- Pipe diameter,  $D_T$ ;
- Concrete conductivity,  $\lambda_{CLS}$ ;
- Pipe conductivity,  $\lambda_T$ ;
- Fluid conductivity,  $\lambda_F$ ;
- Fluid velocity,  $v_F$ .

## STATISTICAL ANALYSIS

Taguchi method

7 parameters, 2 levels  
(upper and lower bound)

| Parameters  | $v_F$ | $\lambda_T$        | $\lambda_F$        | $D_P$ | $L_P$ | $\lambda_{CLS}$    | $D_T$ |
|-------------|-------|--------------------|--------------------|-------|-------|--------------------|-------|
| Units       | m/s   | W/m <sup>2</sup> K | W/m <sup>2</sup> K | mm    | m     | W/m <sup>2</sup> K | mm    |
| Lower bound | 0.4   | 0.6                | 0.6                | 150   | 10    | 1.5                | 12    |
| Upper bound | 1.2   | 20                 | 0.79               | 200   | 20    | 3                  | 20    |

8 simulations (Taguchi «L8» array)

Output values of L8 analysis: exchanged power after 180 days

Level average analysis

Confirmation Run

| Run | $v_F$ | $\lambda_T$        | $\lambda_F$        | $D_P$ | $L_P$ | $\lambda_{CLS}$    | $D_T$ |
|-----|-------|--------------------|--------------------|-------|-------|--------------------|-------|
|     | m/s   | W/m <sup>2</sup> K | W/m <sup>2</sup> K | mm    | m     | W/m <sup>2</sup> K | mm    |
| 01  | 0.4   | 0.6                | 0.6                | 150   | 10    | 1.5                | 12    |
| 02  | 0.4   | 0.6                | 0.6                | 200   | 20    | 3                  | 20    |
| 03  | 0.4   | 20                 | 0.79               | 150   | 10    | 3                  | 20    |
| 04  | 0.4   | 20                 | 0.79               | 200   | 20    | 1.5                | 12    |
| 05  | 1.2   | 0.6                | 0.79               | 150   | 20    | 1.5                | 20    |
| 06  | 1.2   | 0.6                | 0.79               | 200   | 10    | 3                  | 12    |
| 07  | 1.2   | 20                 | 0.6                | 150   | 20    | 3                  | 12    |
| 08  | 1.2   | 20                 | 0.6                | 200   | 10    | 1.5                | 20    |

# Conclusion

- A numerical model was employed to perform a parametric study to assess the most important parameters to maximize the energy performance of EMPs
- The three most important factors in EMP energy performance are
  - pile length
  - concrete conductivity
  - pipe diameter
- Results show that thermal design of EMPs should not be based on the same criteria as those used for EP design
- The energy performance of energy micropiles is comparable to that of standard diameter energy piles
