# Evaluation of SEBAL and METRIC Energy Balance Models for Evapotranspiration Estimation in Precision Agriculture

Ahmed H. Rabia<sup>a,b</sup>, Stefano Lo Presti<sup>c</sup>, Jerome Maleski<sup>d</sup>, Stefano Gobbo<sup>e</sup>, David Bosch<sup>d</sup>, Francesco Morari<sup>e</sup>, and George Vellidis<sup>f</sup>

- a) Plant & Soil Sciences Dept. Texas Tech University, USA.
- b) Faculty of Agriculture, Damanhour University, Egypt.
- c) Centrale Valutativa srl, Roma, Italy.
- d) Southeast Watershed Research Laboratory, USDA, USA.
- e) DAFNAE, University of Padova, Italy.
- f) Crop and Soil Sciences Department, University of Georgia, USA.

Beta testing by farmers  
Available 2019

Under development  
Available 2020

# Soil Profile Water Balance

$$ETc = ETo \times Kc$$

where

ETc = estimated crop ET

Kc = crop coefficient

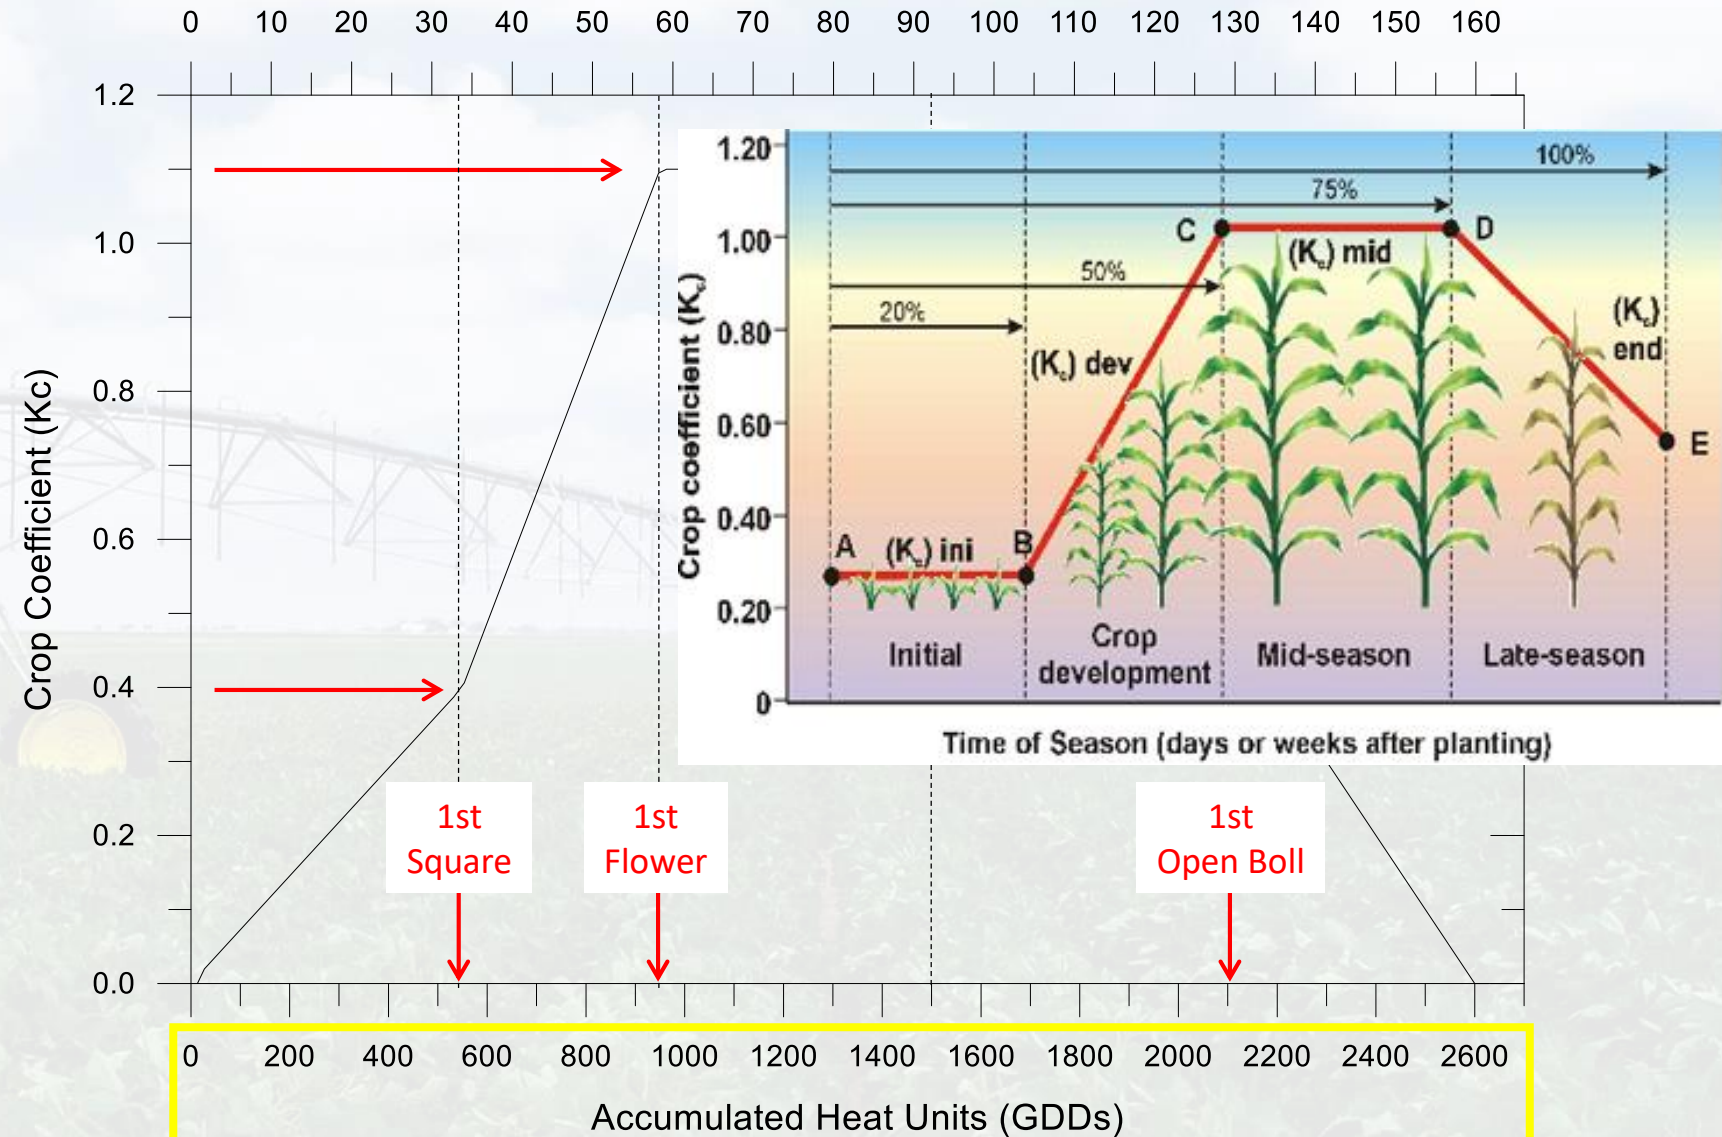

ETo = Penman-Monteith reference ET (**FAO 56**)

$$ET_c = ET_o \times K_c$$

# Crop Coefficient, Kc

Days After Planting (DAP) 2013

## Cotton Growth and Development

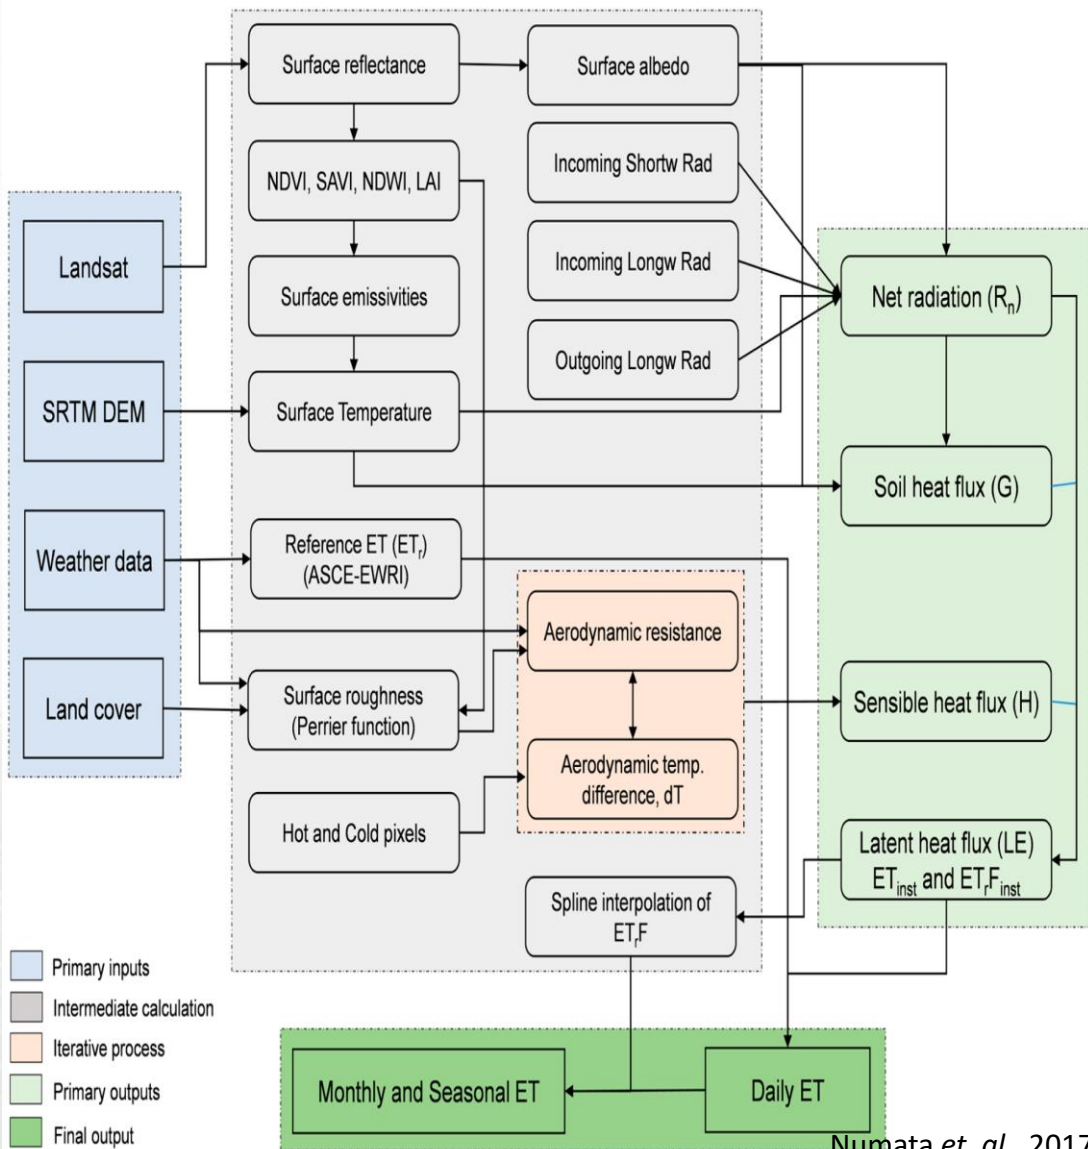

Cotton Irrigation Management for Humid Regions

Cotton Incorporated

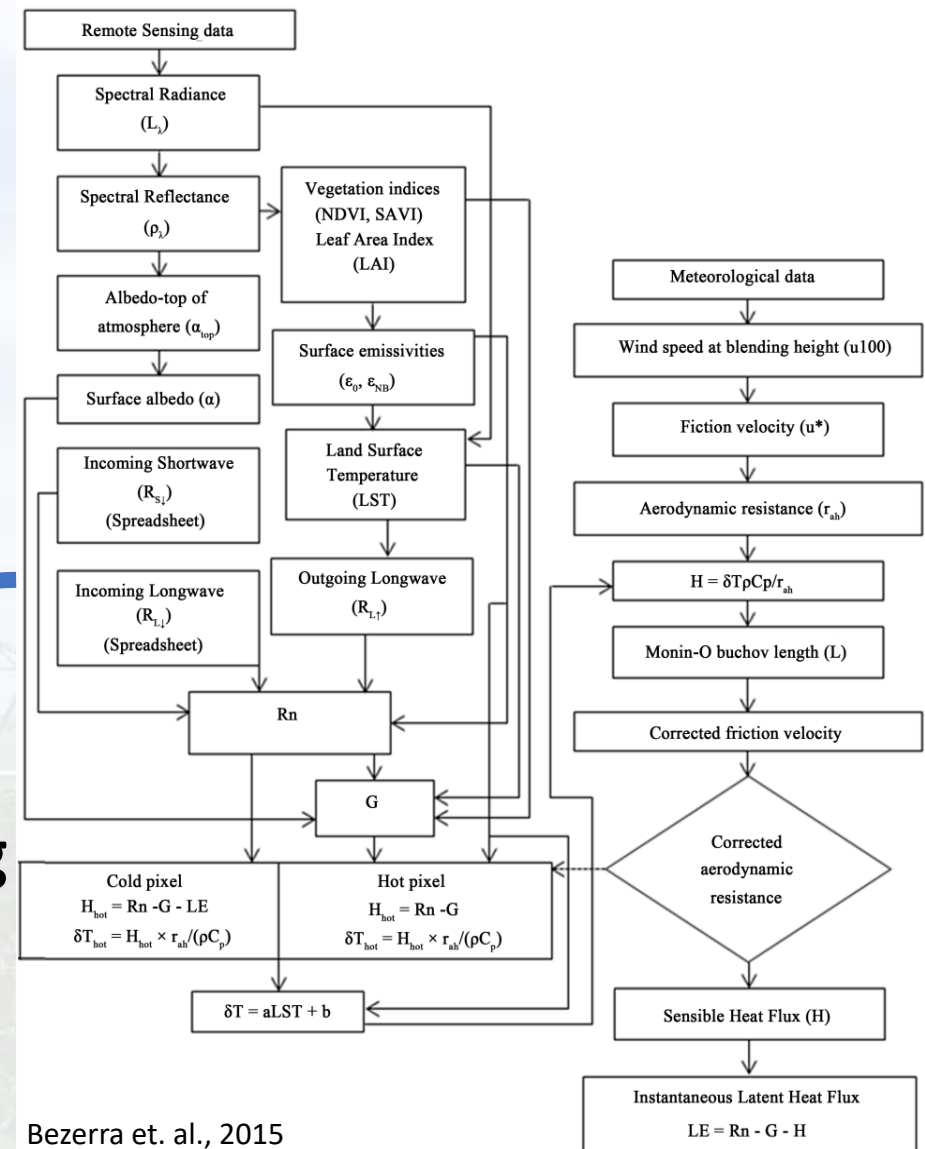

- Find a Suitable model to directly estimate crop Evapotranspiration (ETc) through remotely sensed data.
- Test the model against ground-truth data to evaluate the applicability of integrating the model into the SmartIrrigation Apps.

# Flowchart of METRIC model

# Flowchart of SEBAL model

Data processing

Crop

Evapotranspiration

# Study area

Eddy Covariance Flux Tower

Tift County, Georgia, USA

Soil: Loamy sand

Plant: Corn

Area: 60 Acres

Season: 2016

Ground-truth  
Crop Evapotranspiration (ET<sub>c</sub>)  
measurements

# RESULT

# Crop Evapotranspiration (ETc - mm/day)

• Eddy Covariance

# Crop Evapotranspiration (ETc - mm/day)

• Eddy Covariance

T Rainfall

# Crop Evapotranspiration (ETc - mm/day)

• Eddy Covariance

▲ SmartIrrigation App

T Rainfall

# Crop Evapotranspiration (ETc - mm/day)

• Eddy Covariance

▲ SmartIrrigation App

■ METRIC

● SEBAL

┐ Rainfall

# SmartIrrigation App - Over & Under Estimation of ETc (mm/day)

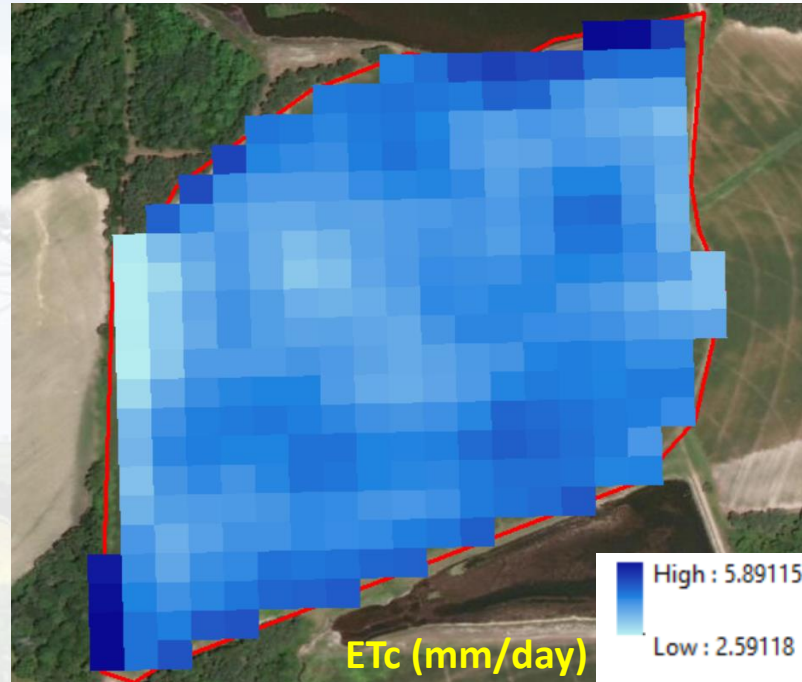

## Over & Under-Estimation of ETC during the growing season

# Crop Evapotranspiration Maps

Experimental Location

SEBAL Model  
9 maps during the season

METRIC Model  
13 maps during the season

# Conclusions

- Using the crop coefficient curve in the SmartIrrigation mobile App to estimate crop evapotranspiration led to underestimation of crop water requirements during both the first and the last growing stages.
- Rainfall amount input from a rain gage in the field or close weather station enhances significantly the ET<sub>c</sub> estimations
- METRIC model showed the highest correlation to the ground-truth data with overestimated values of ET<sub>c</sub> by the end of the growing season.
- Integrating the METRIC model into the SmartIrrigation App may enhance the App efficiency in irrigation scheduling.
- SEBAL model needs to be adjusted before applying in humid environments.

# Future work

- Repeat the same methodology over a number of years to form a clearer picture about the efficiency of the SmartIrrigation Apps and both SEBAL and METRIC models in estimating the crop evapotranspiration
- Integrate the METRIC model into the SmartIrrigation app to improve the irrigation scheduling during the growing season
- Comparing the performance of the SmartIrrigation app before and after the integration of the METRIC model with ground truth values of evapotranspiration

A group of seven people, including six men and one woman, are standing in a grassy area next to a large field of tall corn plants. The cornfield is on a slight rise, and a dirt road runs alongside it. In the background, there are trees and a clear blue sky with some clouds. A small white flag is visible in the lower left corner, near some equipment.

# Thank you
