

Improving flood damage assessments by retrieving building characteristics through automated UAV image processing

Lucas Wouters
Msc. Hydrology

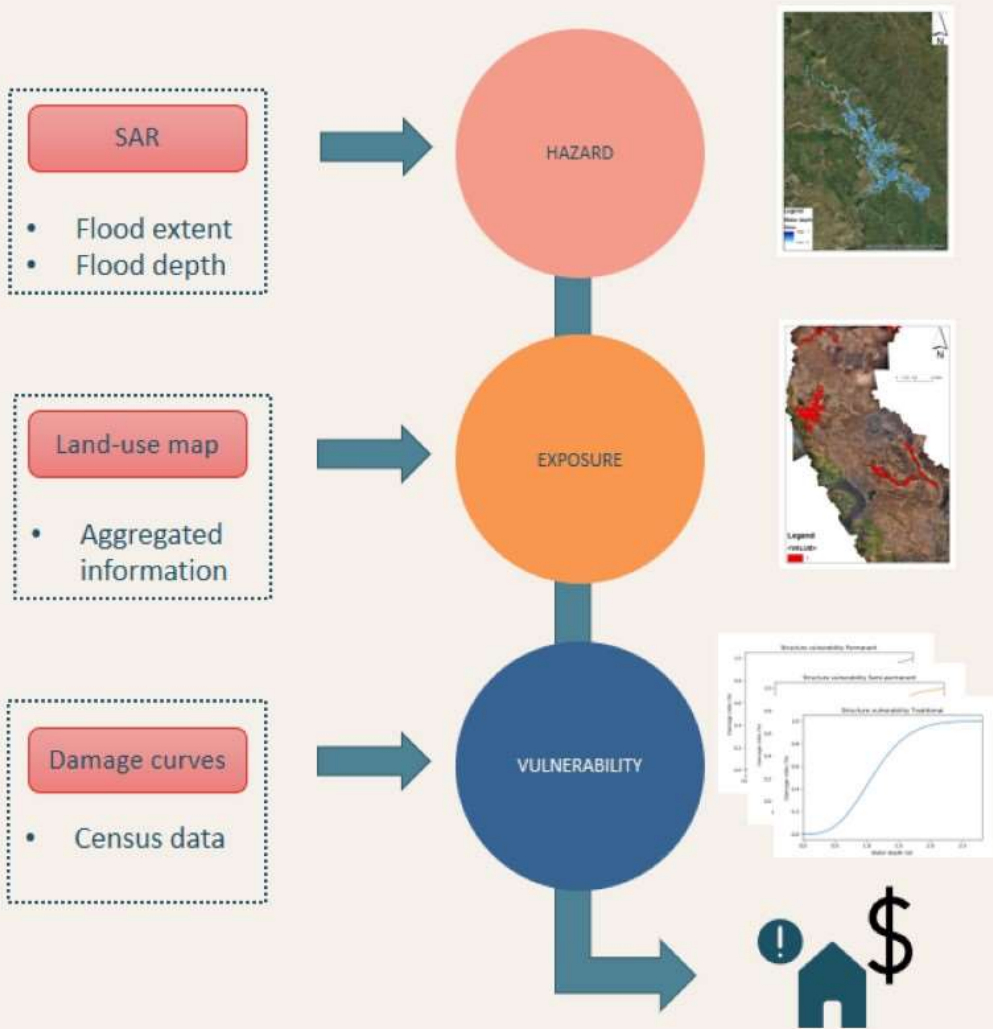

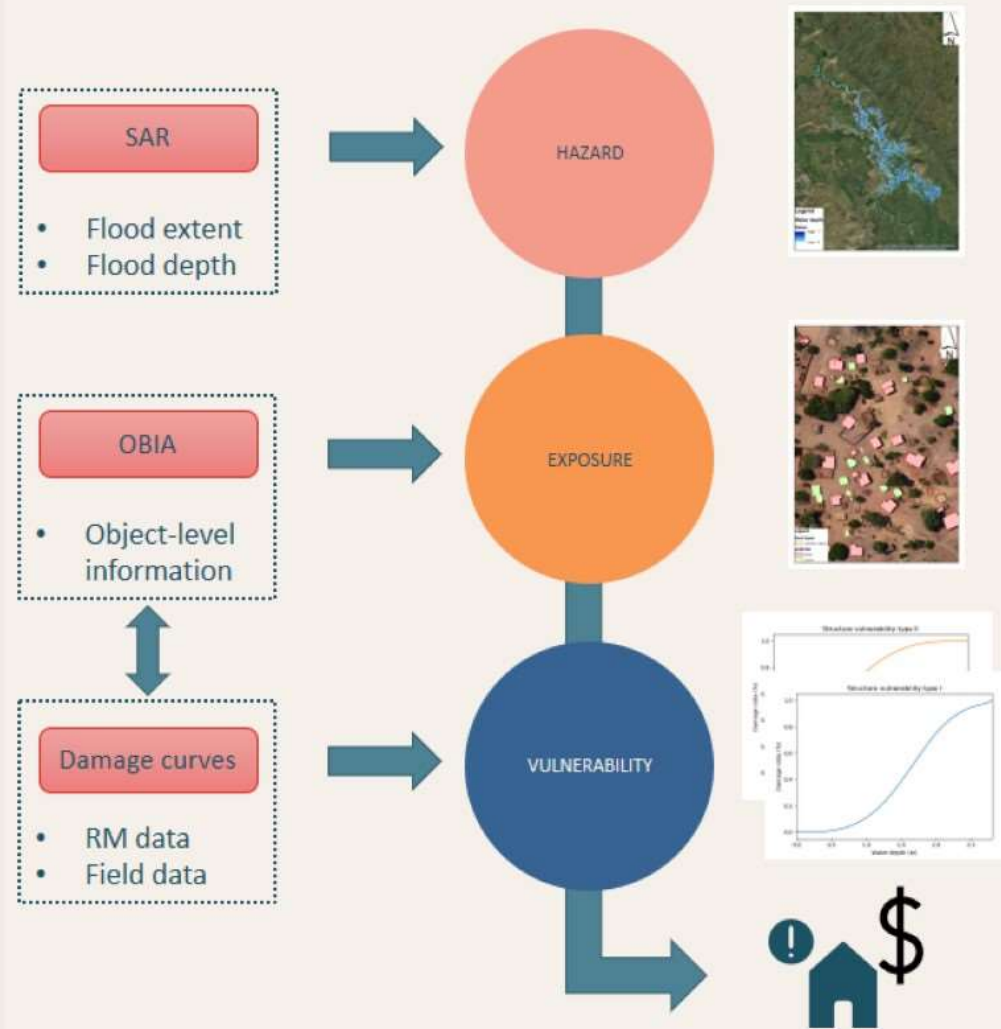

Objective: create flood damage model based on the of the automated image processing of UAV imagery

- Generate flood susceptibility information on object (building) level
- Compare flood damage with a land-use (pixel) model

Pixel-based approach

Object-based approach

Object-based Image Analysis

Segmentation

- Mean-shift

Classification

- Support Vector Machine
- Based on spectral properties and height

Orfeo-Toolbox

Drone imagery collected by the Netherlands Red Cross/510

Damage curves

Census data building stock:

- Permanent
- Semi-permanent
- Traditional

Flood hazard & damage assessment

$$Damage [\$] = \sum_{i=1}^3 damage(i) * ba(i) * rc(i) [\$]$$

Where:

- i = the building typology as determined by the classification
- $Damage(i)$ is the damage represented through the damage curve, using as input the water depth [m]
- $ba(i)$ is the area of the building in m^2
- $rc(i)$ is the replacement costs per m^2 based on the typology (i)

Performance statistics

Confusion matrix

		Positive	Negative
Actual value	Positive	TP	FN
	Negative	FP	TN
		Prediction outcome	

TP = predicted + manual
 FP = predicted x manual
 TN = manual x predicted
 FN = not detected

Accuracy:
(0 – 1)

$$A = \frac{TP + TN}{TP + FP + TN + FN}$$

F1-score:
(0 – 1)

$$F1 - Score = 2 * \frac{P * R}{P + R}$$

$$R = \frac{TP}{TP + FN}$$

$$P = \frac{TP}{TP + FP}$$

Cohen Kappa:

$$\kappa = \frac{A - Pa}{1 - A}$$

$$Pa = \frac{1}{n^2} \sum_{i=1}^c p_i + p_{+i}$$

Value of K	Strength of agreement
< 0.20	Poor
0.21 - 0.40	Fair
0.41 - 0.60	Moderate
0.61 - 0.80	Good
0.81 - 1.00	Very good

Results & discussion

Flood damage

	Object	Pixel	OSM
# of buildings	1466	1514	1352
# flooded	84	90	97
Damage (€)	10,140.-	15,728.-	-

- Difference in exposure (#, and size)
- Approach specific damage curves

OBIA performance

Category	F1-score	F1-score (height)	Accuracy	Kappa
Vegetation	0.91	-	0.77	0.71
Metal roof	0.89	0.90		
Thatch roof	0.53	0.75		
bare ground	0.49	-		
shadow	0.90	-		

Conclusions & Recommendations

Object-based approach using UAV imagery to calculate flood damage

Flood damage:
Object < Pixel

Accuracy results vary among
categories due to spectral
similarities

Justify assumptions of roof and
wall material with more samples

Combine results of OBIA with
homogenous pixels maps scale
up
