ON STATISTICAL MODELING OF EXTREME RAINFALL PROCESSES FOR URBAN WATER INFRASTRUCTURE DESIGN IN THE CONTEXT OF CLIMATE CHANGE

Van-Thanh-Van Nguyen
and
Others (Students and Collaborators)

OUTLINE

- **Urban Water Management** - Challenges and Issues?
- **Climate Variability and Climate Change** - Scale Mismatch?
- **Objective:** Modeling of Extreme Rainfall Processes in the Climate Change Context
- **Methods and Practical Tools**
 - **Decision-Support Tool**
 - **Technical Guideline**
- **Conclusions**

Urban Environmental Challenges and Issues

- **Population Growth: Water Stress**
- **Urbanization: Land-use Change Impacts**
- **Climate Change Impacts:**
 - **Water Quantity Issues:** floods, droughts, water supply, etc.
 - **Water Quality Issues:** water pollution, water treatment, etc.
 - **Public Health:** heat-related mortality, spreading of infectious diseases, etc.
 - **Transportation:** road maintenance, etc.
 - **Infrastructure:** durability of materials, etc.

Figure 1: Population Changes and Carbon Emissions Under IPCC SRES Scenarios

Data Sources: Figure is based on the output of the climate model MESSAGE by the International Institute for Applied System Analysis (IIASA).

HOW TO ASSESS THESE IMPACTS ON HYDROLOGIC PROCESSES AT THE CATCHMENT SCALE (e.g., “SMALL” URBAN AREAS)?

➡ **The SPATIAL and TIME SCALE Issues?**

Climate Variability and Climate Change

■ How to Quantify Climate Change?

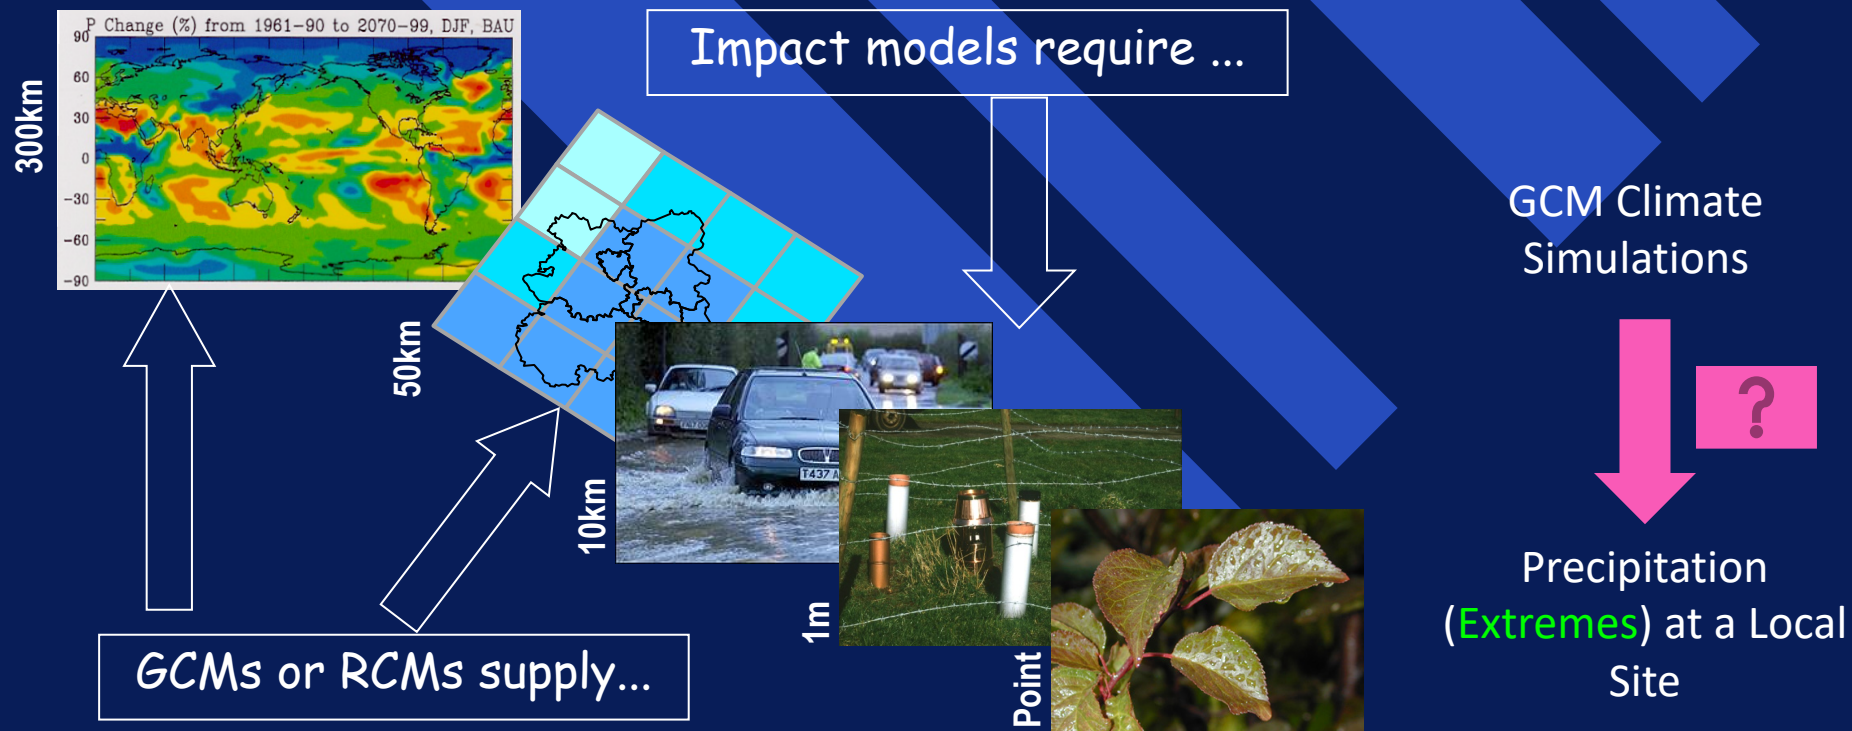

General Circulation Models (GCMs):

- A credible simulation of the “**average**” “**large-scale**” seasonal distribution of atmospheric pressure, temperature, and circulation.
- Climate change simulations from GCMs are “**inadequate**” for impact studies on regional scales:
 - Spatial resolution ~ **50,000 km²**
 - Temporal resolution ~ **daily, month, seasonal**
 - Reliability of some GCM output variables (such as **cloudiness** → precipitation)?

How to develop **Climate Change scenarios** for impacts studies in hydrology?

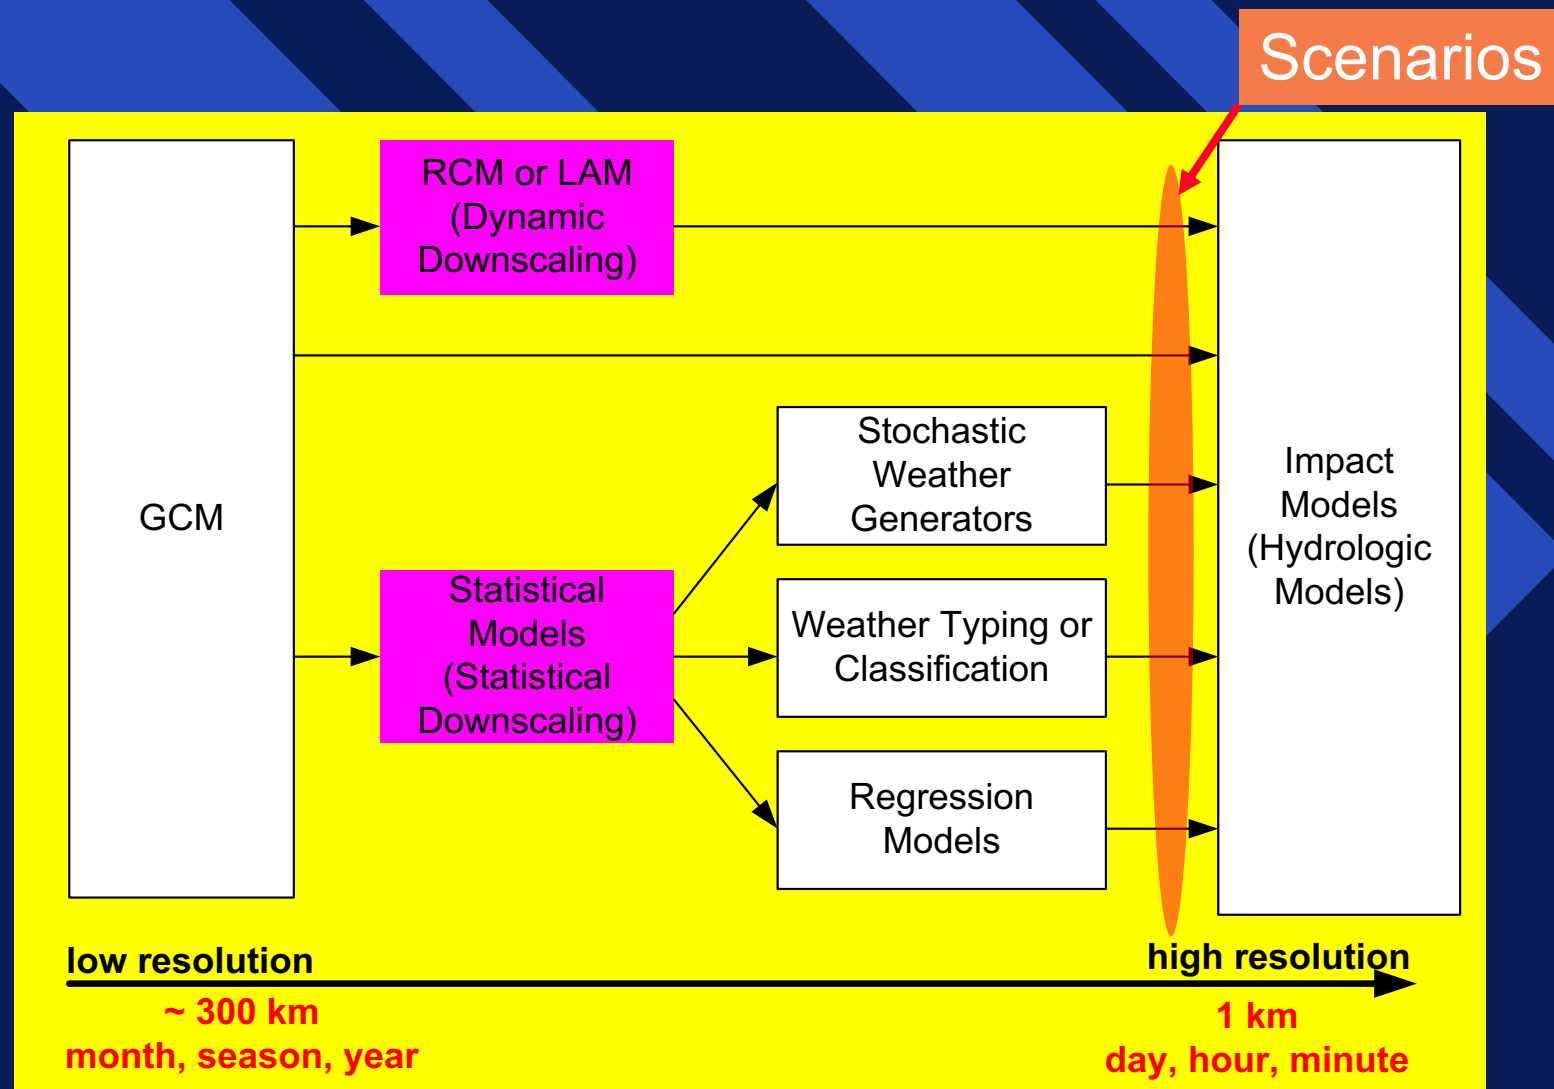

- ◆ **Spatial scale** ~ a few km² to several 1000 km²
- ◆ **Temporal scale** ~ minutes to years
- ➔ A **scale mismatch** between the information that GCM can confidently provide and the scales required by impacts studies.
- ➔ **“Downscaling methods”** are necessary!!!

4. Research Program: Themes/Projects

4. Research Program: Outcomes

Theme	Examples of outcomes
Theme 1	<ul style="list-style-type: none"> Manual and statistical tools for flood frequency analysis in Canada. New guidelines and procedures for updating IDF curves.
Theme 2	<ul style="list-style-type: none"> New optimization framework for multi-reservoirs operation. Forecast system evaluation tool and guidelines for the use of ensemble forecasts in operational flood forecasting.
Theme 3	<ul style="list-style-type: none"> Data estimation tool for addressing the common issue of the paucity of monitoring networks. Canadian adaptive flood forecasting and early warning system (CAFFEWS).
Theme 4	<ul style="list-style-type: none"> Integrated flood vulnerability indicators for planning and decision making. New knowledge for enhanced understanding of flood impacts on agricultural lands and aquatic ecosystems.

PROJECT OBJECTIVE AND KEY CHALLENGES

OBJECTIVE:

Evaluate **climate change impacts** on Intensity-Duration-Frequency (IDF) curves and develop new **regional IDF curves** for selected cities in Canada.

KEY CHALLENGES:

- **Climate Change Impacts:**
 - **Downscaling** Approaches
 - **Non-stationarity** Process
- **Single-Site and Regional Rainfall Modeling:**
 - **Multi-site Modeling** Methods
 - **Regionalization** Methods (**Ungaged** Sites)

IDF RELATIONS

ISSUES:

- To analyze **a large amount of data** for different time scales and for different stations.
- To select **a suitable probability distribution** for a given site or region.
- To develop IDF relations **for the current climate**.
- To assess **the climate change impacts** on IDF relations.

Probability of extreme rainfall occurrence & amount ???

Extreme rainfall estimation

Design Rainfall = to estimate **maximum amount** of rainfall at a given site for **a specific duration and return period** \Rightarrow **Intensity-Duration-Frequency (IDF) curves**

Multisite and Multivariate Statistical Downscaling Approach

- Spatial (between-site) correlation
- Temporal (at-site) correlation
- Correlation between Tmax and Tmin

Daily Extreme Temperatures:

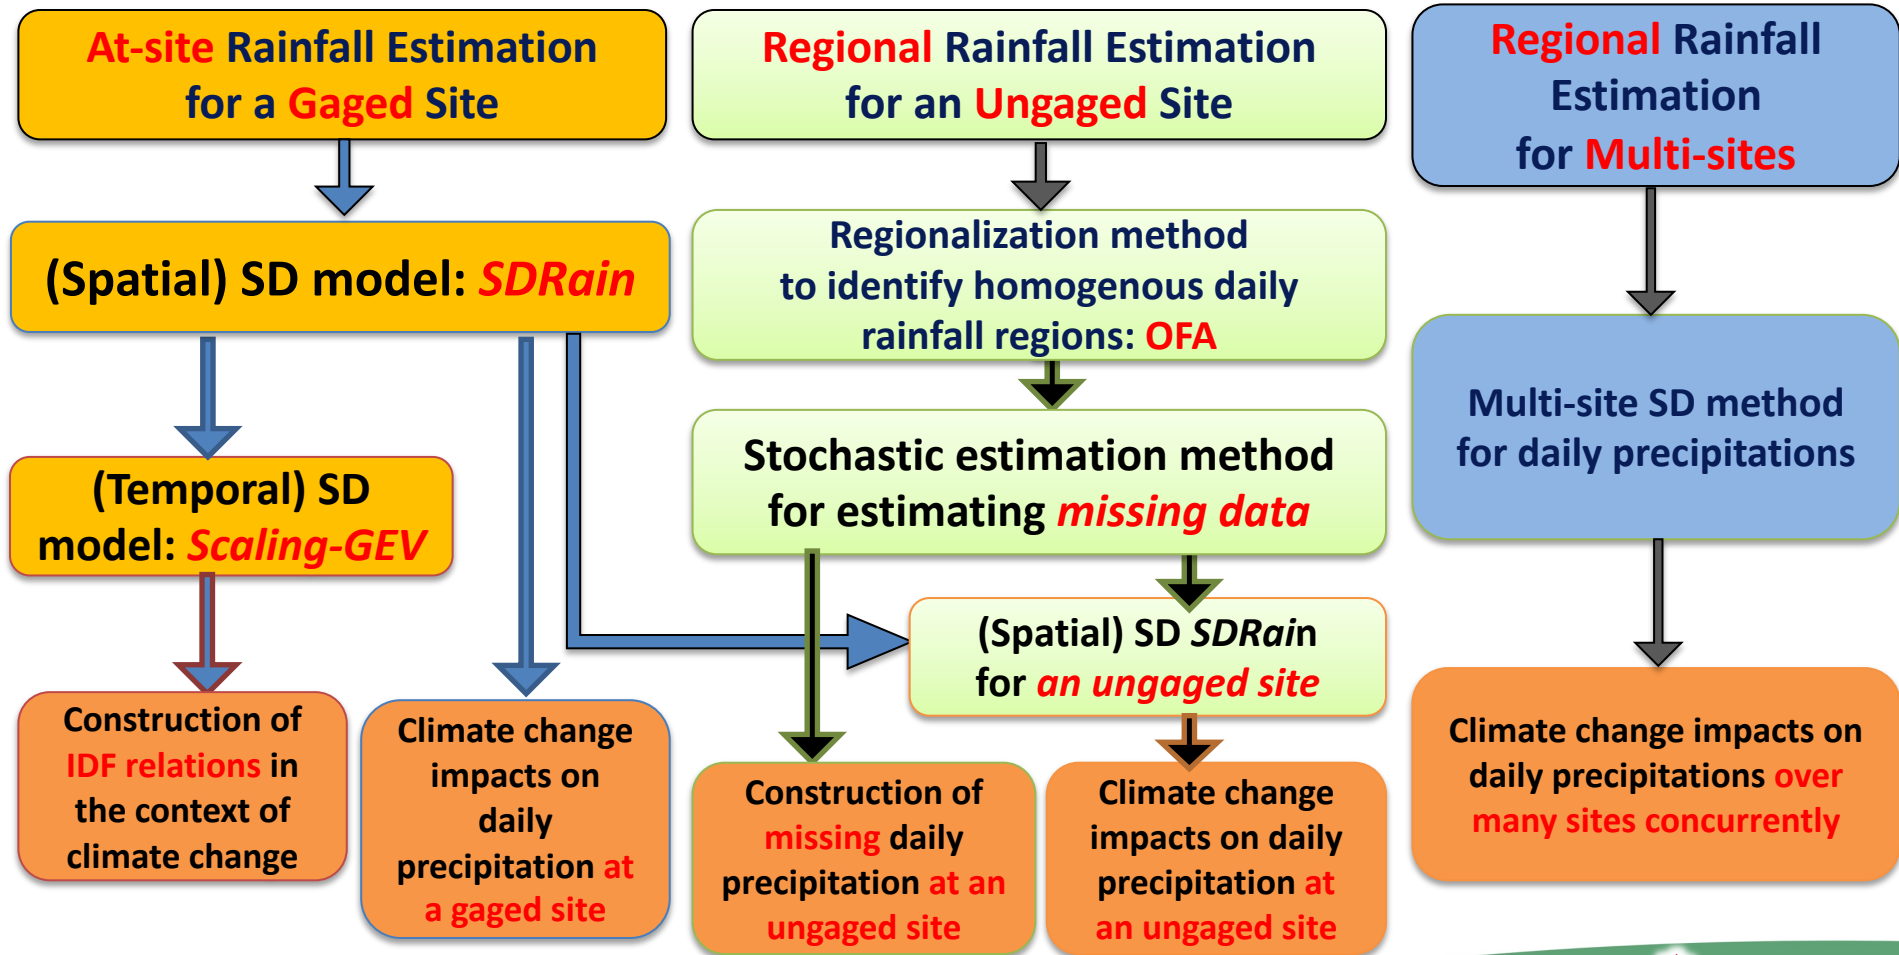

- Khalili et al., Int. J. Climatology, 2011
- Khalili and Nguyen, ASCE J. of Hydrologic Eng., 2018.

Daily Precipitation Series:

- Khalili and Nguyen, Climate Dynamics, 2017
- Khalili and Nguyen, Stoch. Env. Res. and Risk Ass., 2018

SUMMARY OF RESEARCH PROGRESS:

Climate Change Impacts on Extreme Rainfalls - SDExRain

CONCLUSIONS

- ❑ **Significant advances** have been achieved regarding the global climate modeling. However, GCM/RCM outputs are still **not appropriate** for assessing climate change impacts at the regional or local scales.
- ❑ Downscaling methods provide **useful tools** for this assessment.
- ❑ In general, statistical downscaling models could provide “**good**” but “**biased**” estimates of the observed statistical properties of the **daily** precipitation and extreme temperature processes at a local site. Hence, **bias-correction methods are required**.
- ❑ It is **feasible** to assess the impacts of climate change on runoff at small watershed scales using the proposed precipitation downscaling methods for **gaged** and **ungaged** sites.
