

## Cumulated afterslip through time

## Daily slip of this patch

## Afterslip daily moment and seismicity

- Afterslip mainly localised at mainshock edges
- Early afterslip mainly down-dip of the rupture
- Afterslip develops and propagates North of the rupture and lead in two large aftershocks (75 km North of the rupture)

Mainshock slip (Klein et al. 2017) contoured every 2 m in blue. Largest aftershocks slip contoured every 50 mm in green. Gray dots show seismicity (Ruiz et al. 2016 & CSN catalog). Slab2.0 (Hayes et al. 2018) gray contours every 10 km.
