University of Alabama-Huntsville, AL USA

Introduction

- Cold pools are evaporatively cooled air within falling precipitation that flows outward from the base of thunderstorms (Thorpe et al., 1982).
- Cold pools alter the fluxes of heat from the ocean surface to the atmosphere (Feng et al., 2015).
- Secondary convective initiation is possible at the cold pool boundaries (Emanuel et al., 1994).
- Although cold pools are frequent over tropical oceans, they are relatively unobserved phenomenon (Feng et al., 2015).

Motivation and Aim

- Recent advances in supercomputing have allowed us to run high-resolution cloud-resolving models (CRMs) globally (Satoh et al., 2019).
- These global models are an excellent tool to test and validate hypotheses about how cold pools affect the environment and vice versa.
- In this section, 2.5 km global Icosahedral Nonhydrostatic (ICON) model is used to analyze tropical oceanic mesoscale cold pools.

ICOsahedral Nonhydrostatic (ICON) Model

01 August – 11 September 2016

- Part of DYnamics of the Atmospheric general circulation Modeled On Non-hydrostatic Domains (DYAMOND) initiative
- 2.5 km global icosahedral grid
- 90 vertical levels
- T_v anomaly to identify Cold Pools

Science Questions

How are the cold pool-attributed environmental properties across global tropics?

What are the diurnal modes of tropical oceanic cold pools in a CRM?

How can we explain the relationship between environment and cold pool properties in a global CRM?

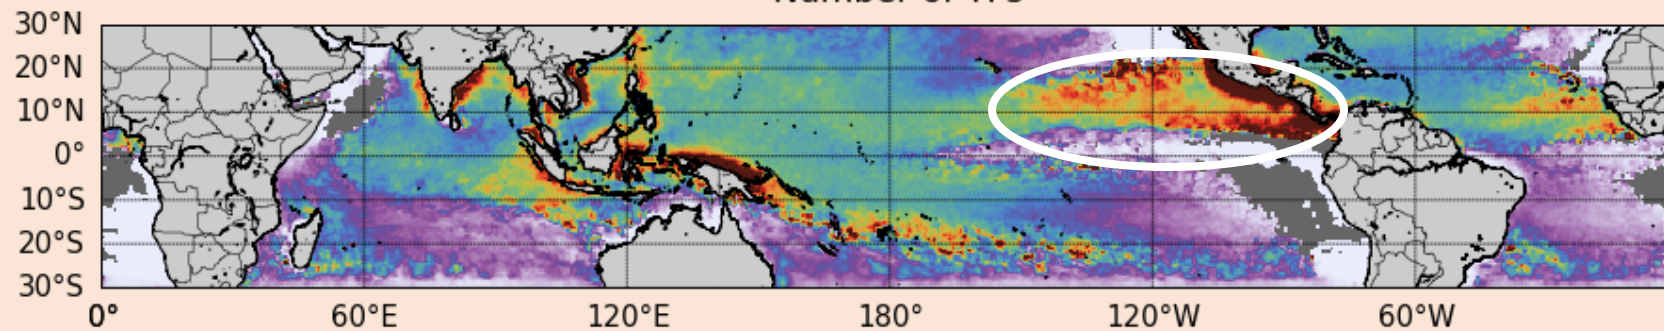

Science Question I

How are the cold pool-attributed
environmental properties across global tropics?

How are the cold pool-attributed environmental properties across global tropics?

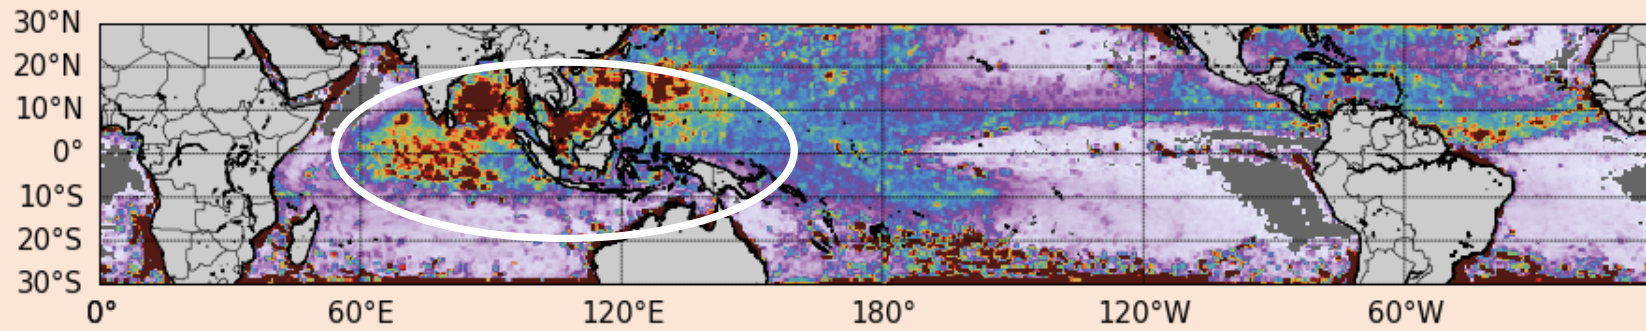

Number of TFs

TF Precipitation ($\text{mm } 15\text{min}^{-1}$)

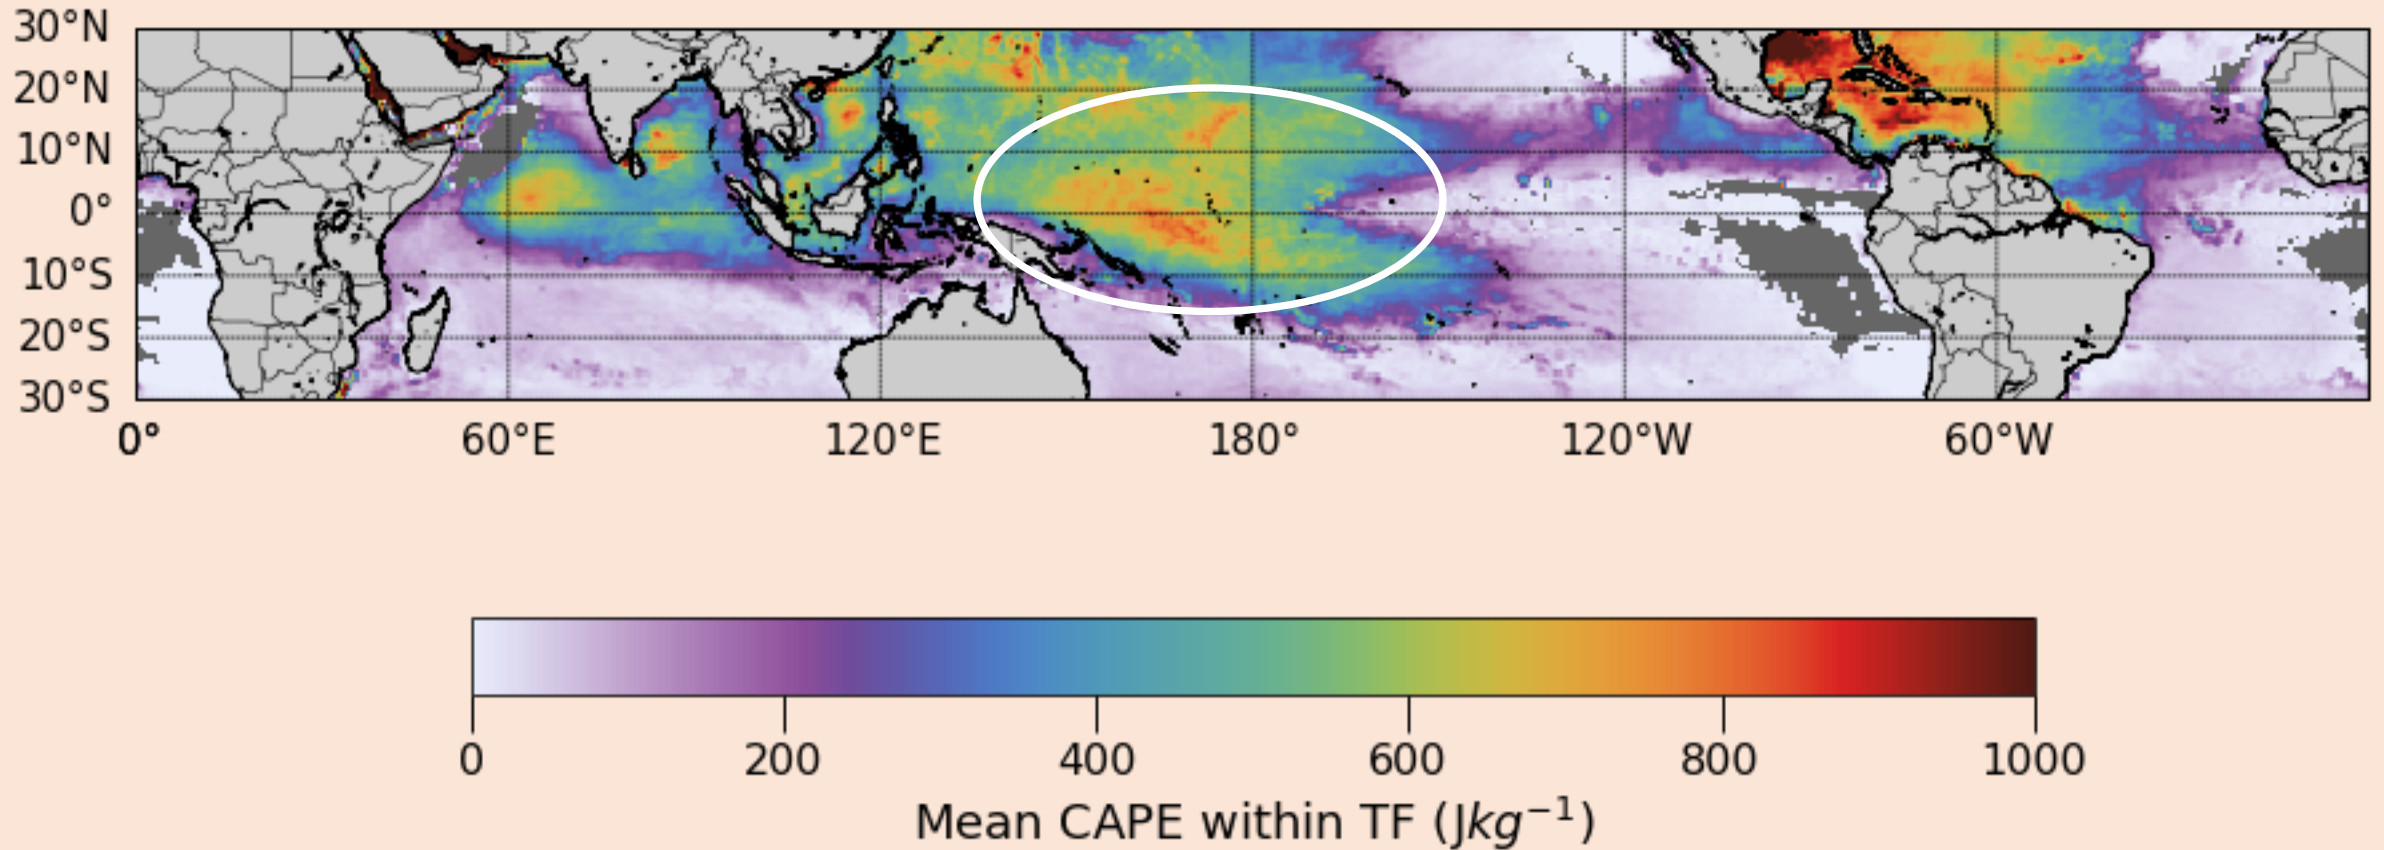

How are the cold pool-attributed environmental properties across global tropics?

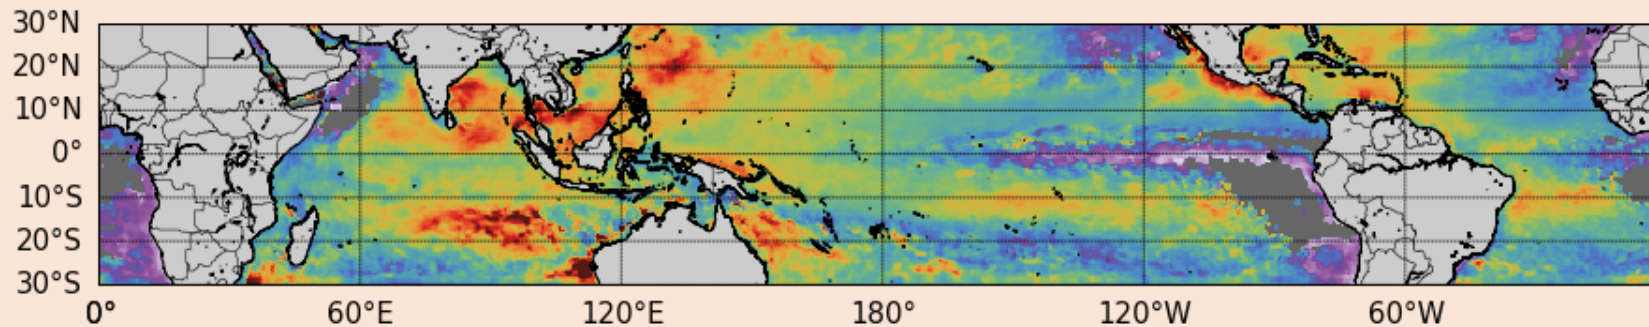

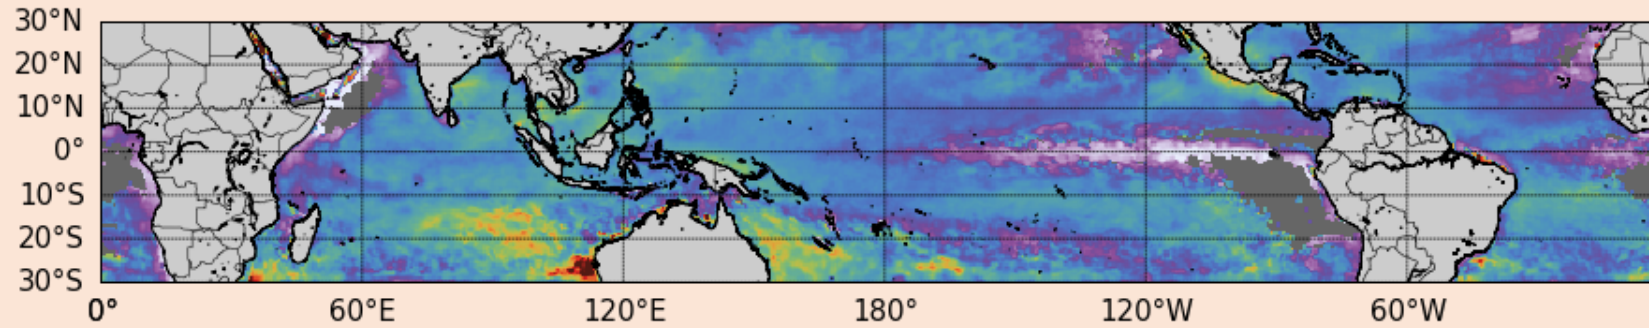

How are the cold pool-attributed environmental properties across global tropics?

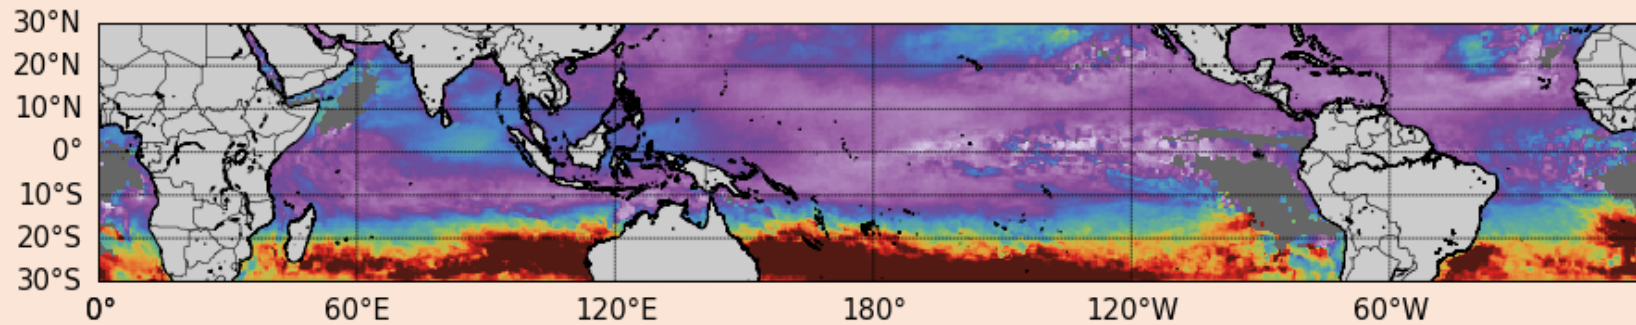

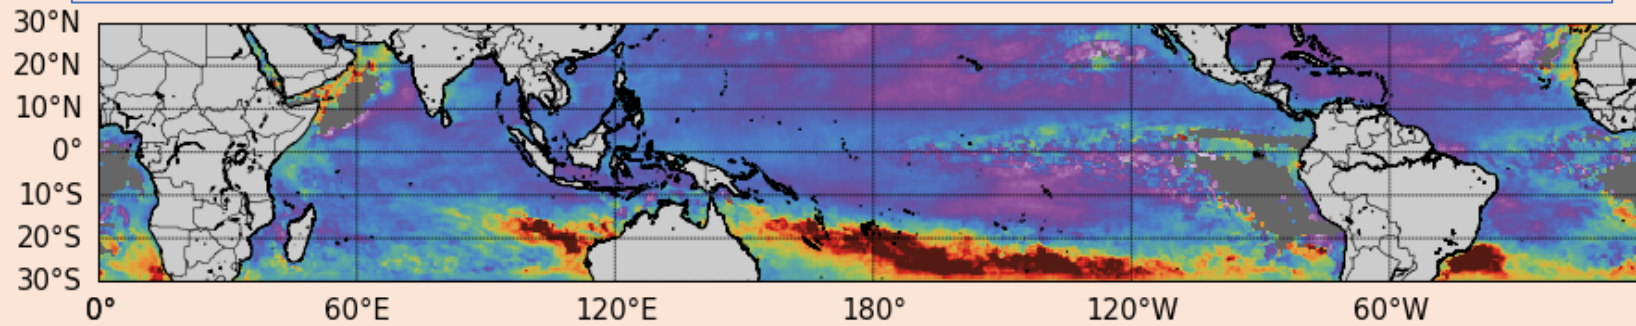

How are the cold pool-attributed environmental properties across global tropics?

How are the cold pool-attributed environmental properties across global tropics?

How are the cold pool-attributed environmental properties across global tropics?

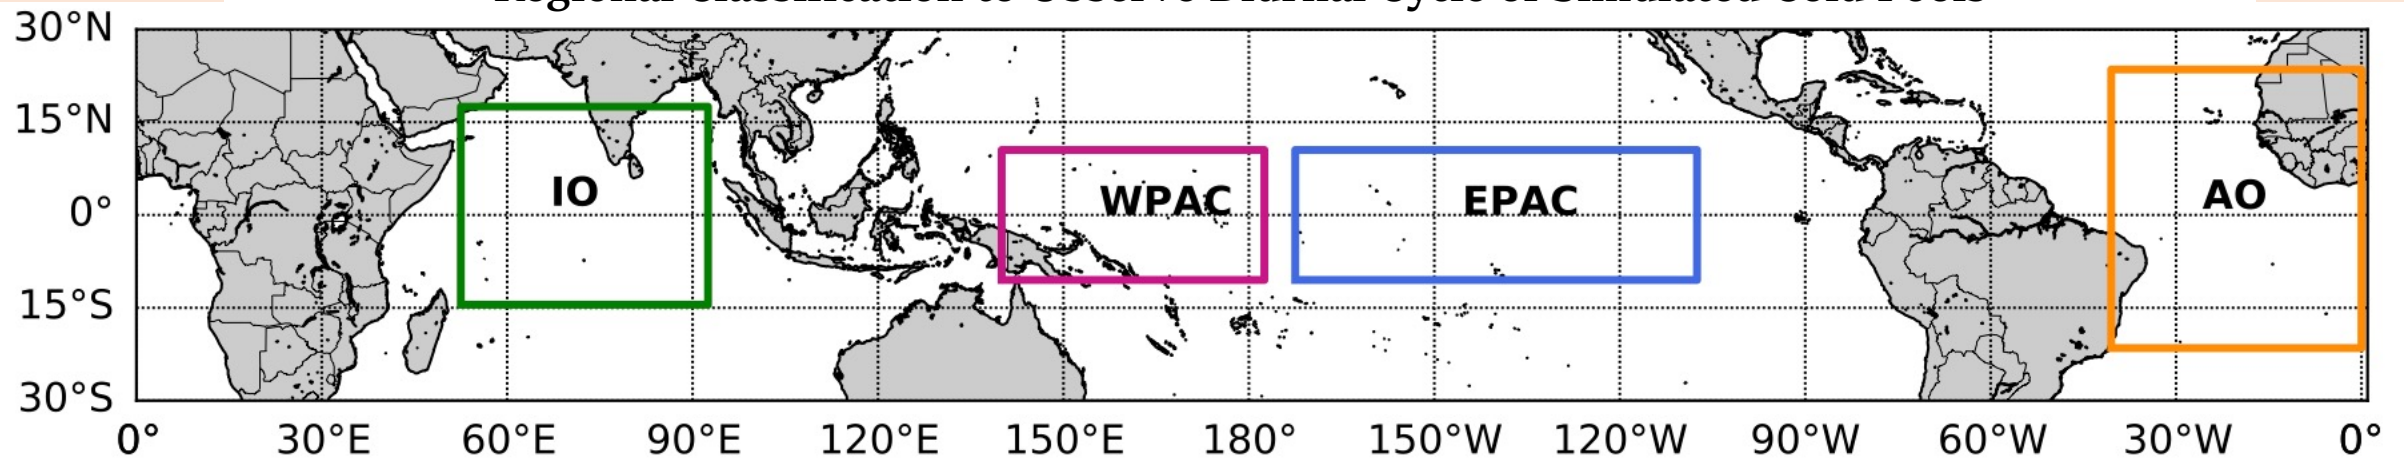

Science Question II

What are the diurnal modes of tropical oceanic cold pools in a CRM?

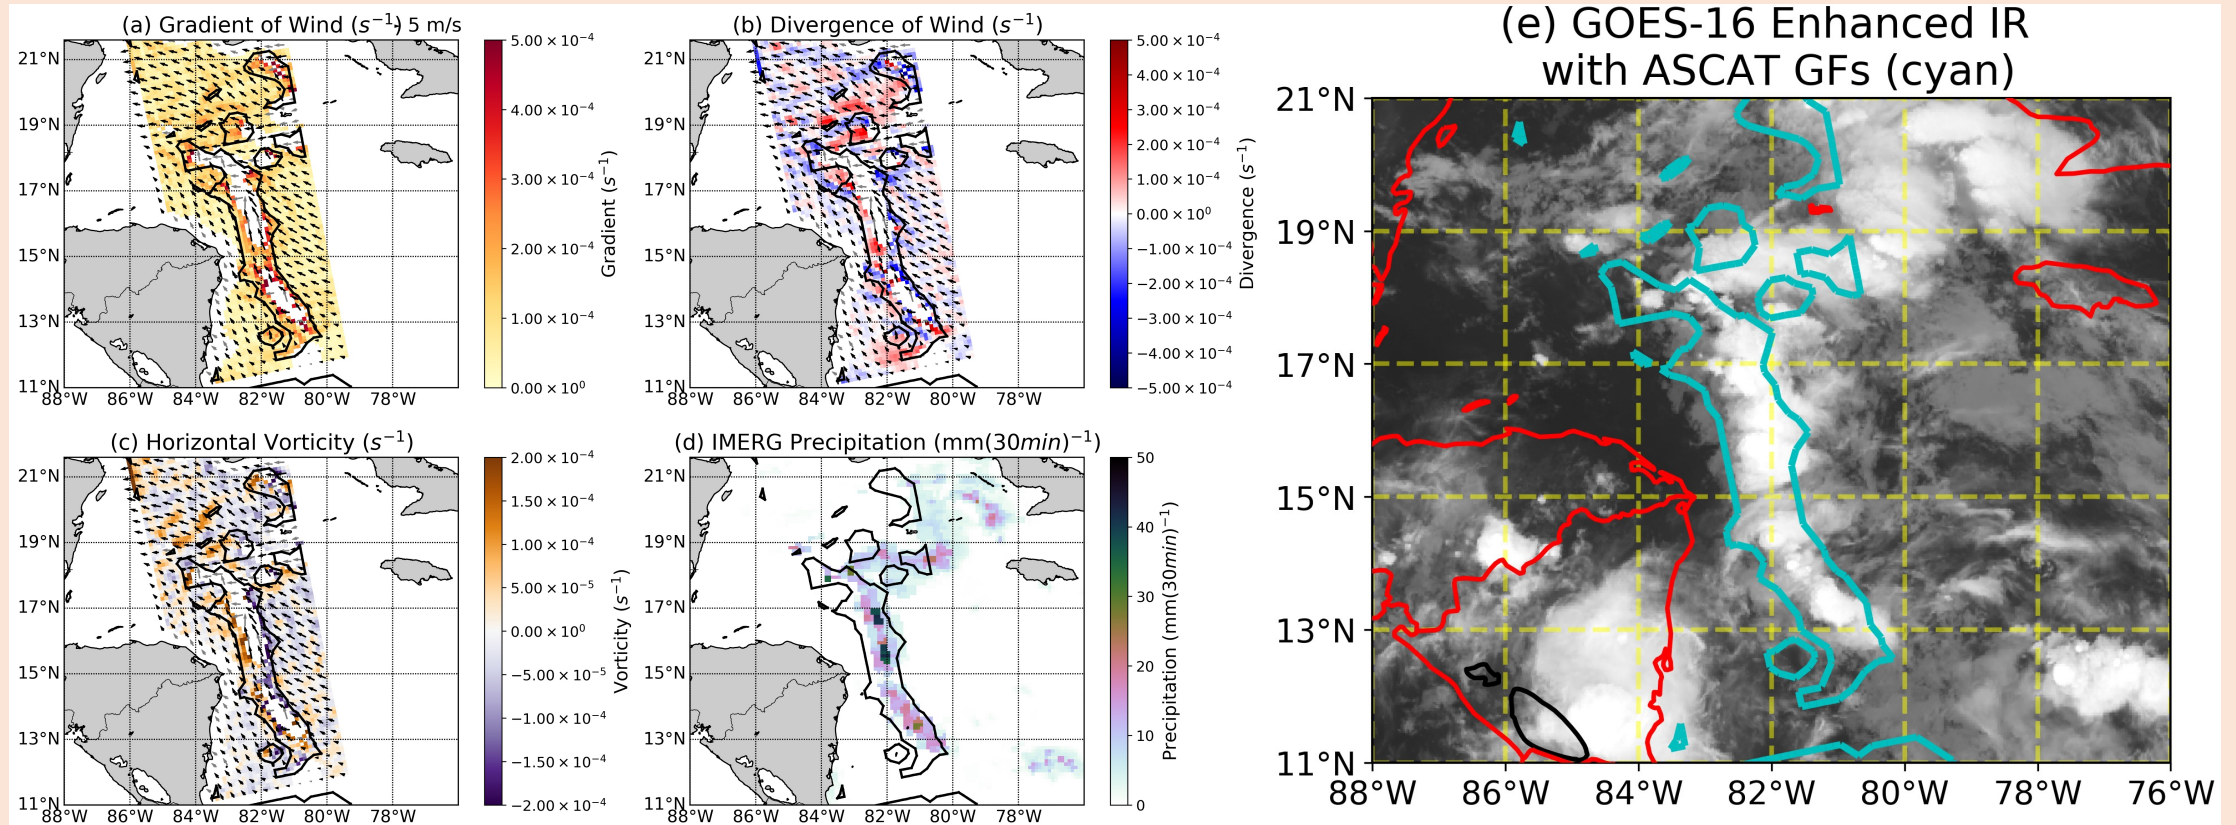

What are the diurnal modes of tropical oceanic cold pools in a CRM?

Regional Classification to Observe Diurnal Cycle of Simulated Cold Pools

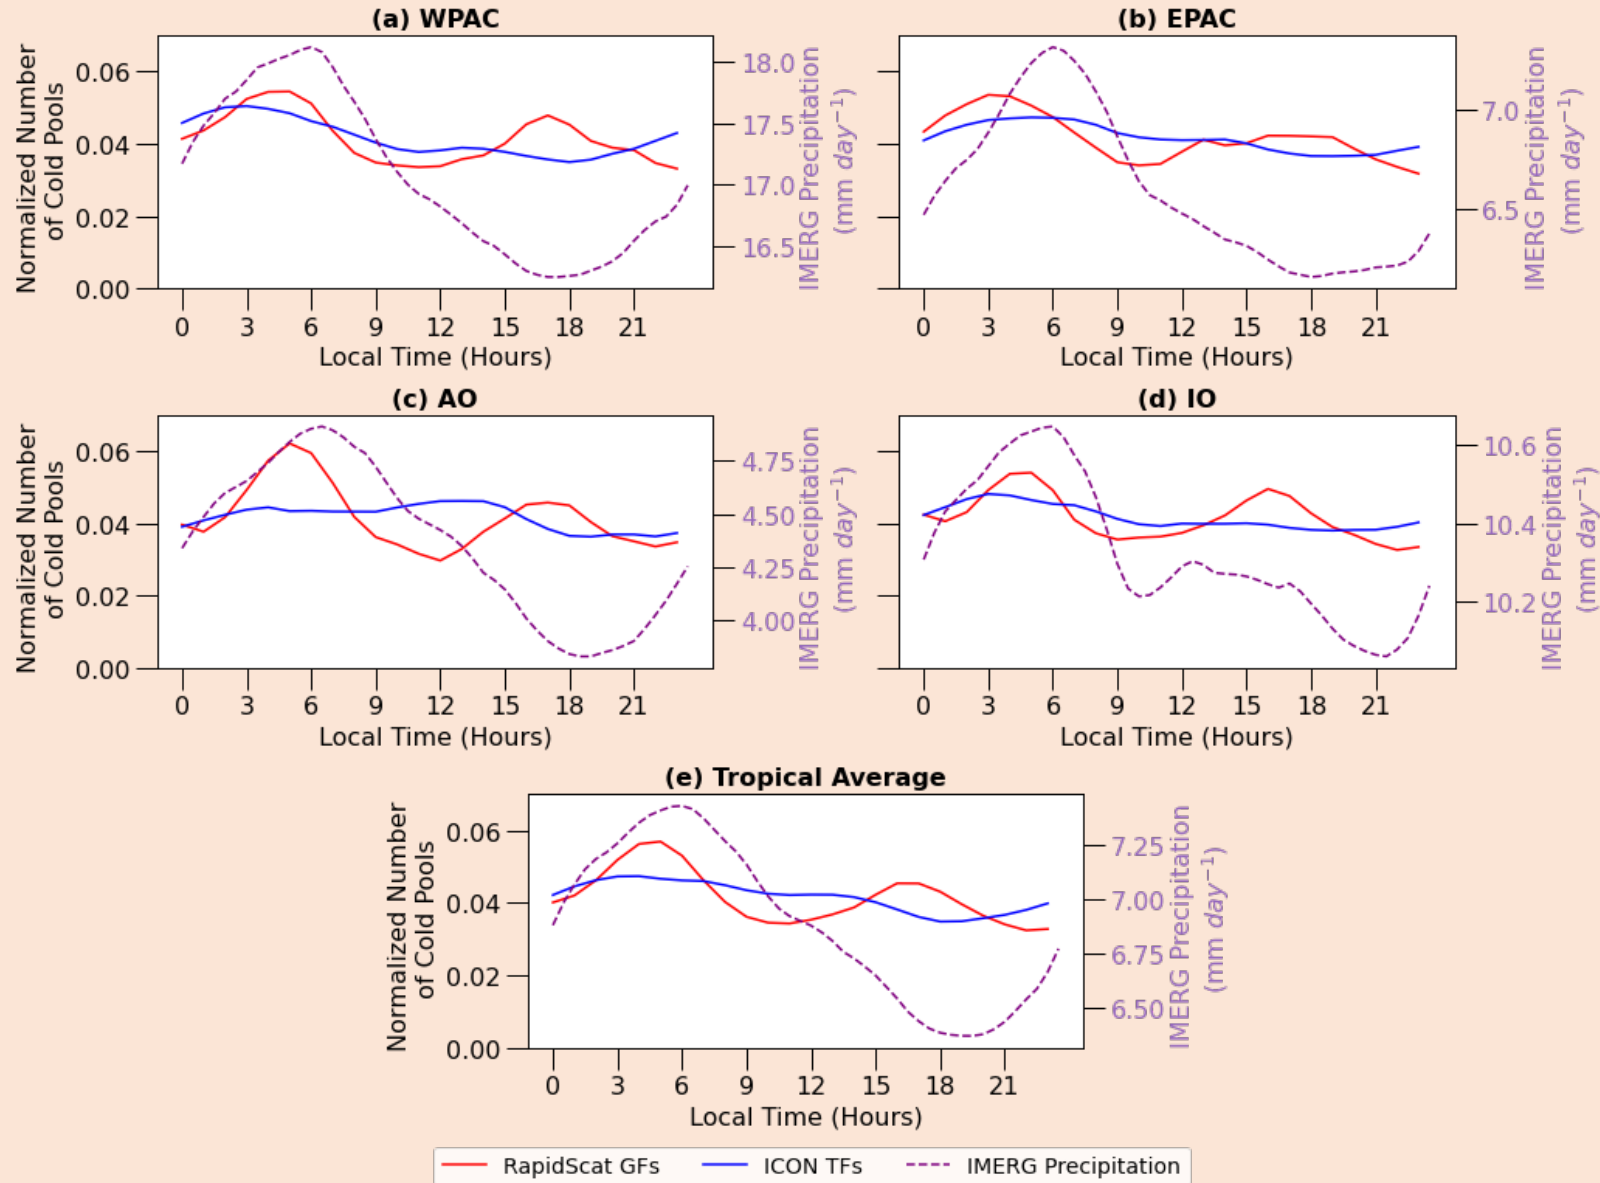

ASCAT-Identified GFs

Garg et al. (2020) JGR-Atmospheres

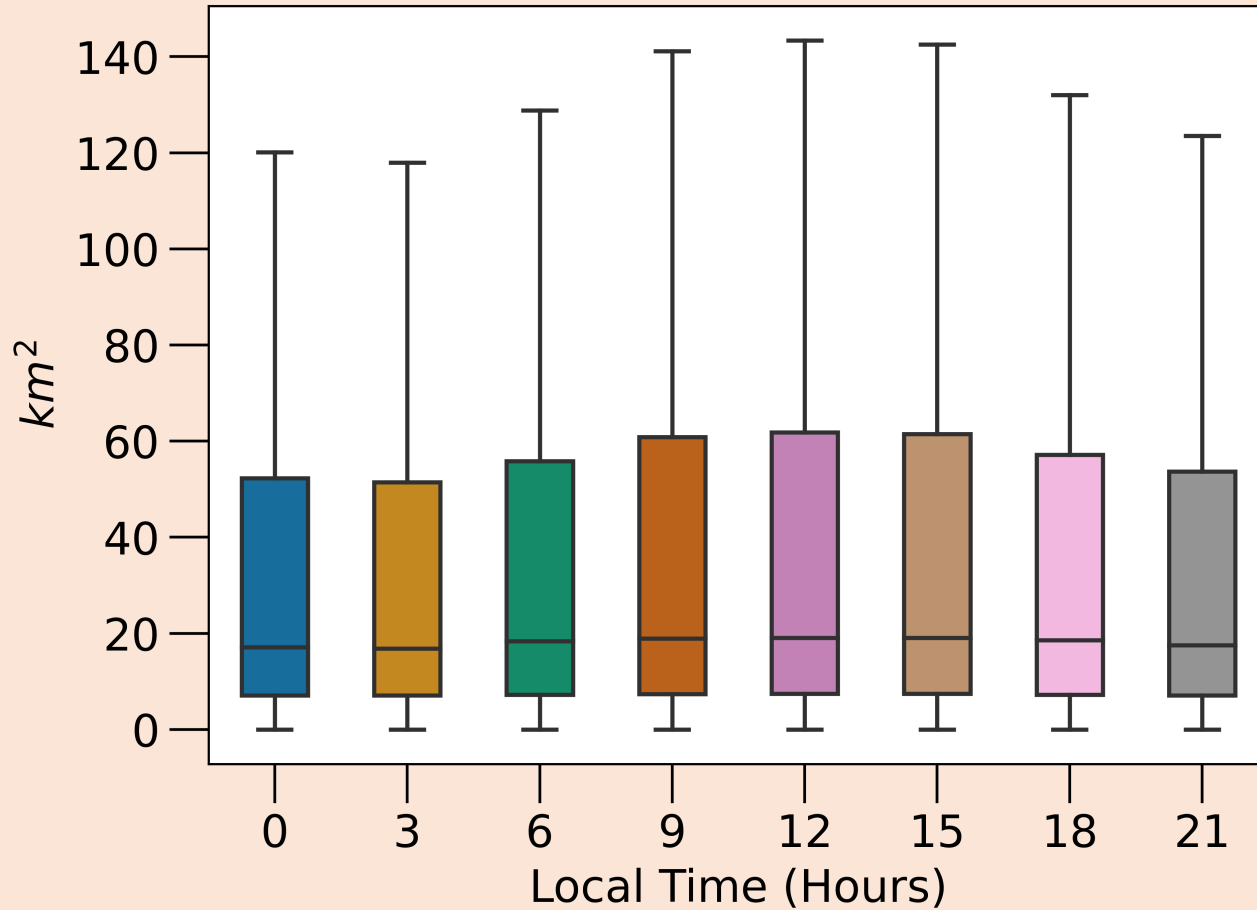

What are the diurnal modes of tropical oceanic cold pools in a CRM?

What are the diurnal modes of tropical oceanic cold pools in a CRM?

(a) TF Size

(b) TF Precipitation

Science Question III

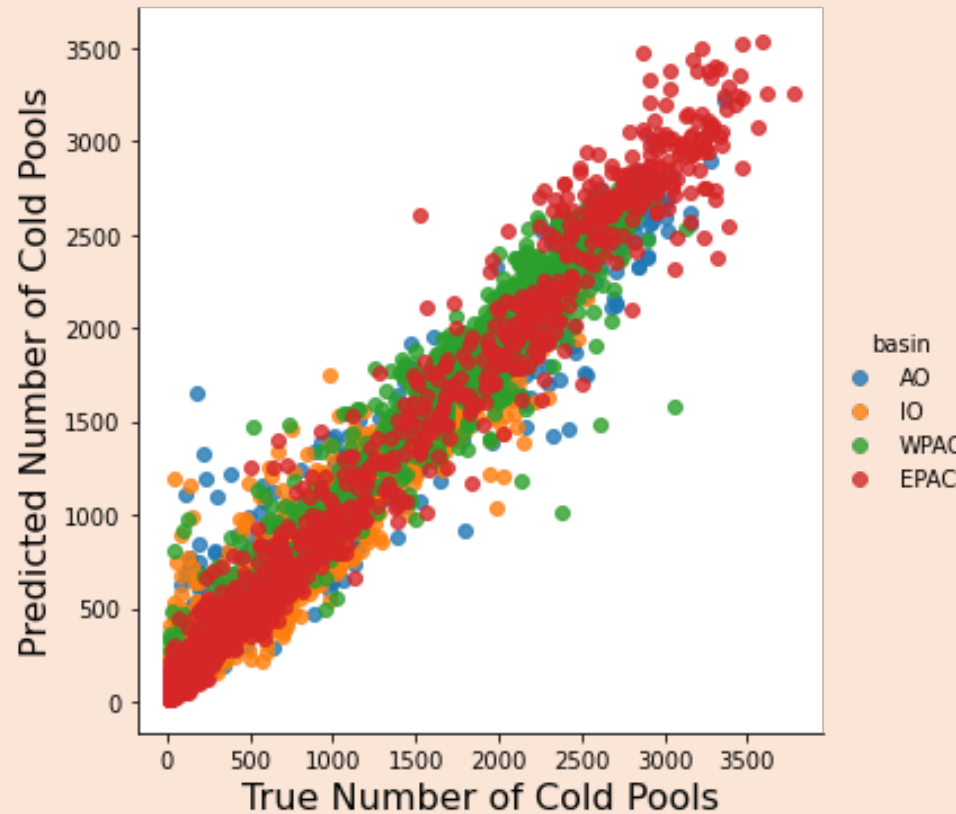

How can we explain the relationship between environment and cold pool properties in a global CRM?

Current Ongoing Work

Identify Relationships between Environmental Properties and Number, Size and Intensity of ICON-Simulated Cold Pools using Machine Learning.

Example shown here is to predict number of cold pools using Random Forest Regression. R^2 Score: 0.94 and RMSE of 0.23

Predictors:

TCWV

CAPE

0-600 hPa Wind Shear

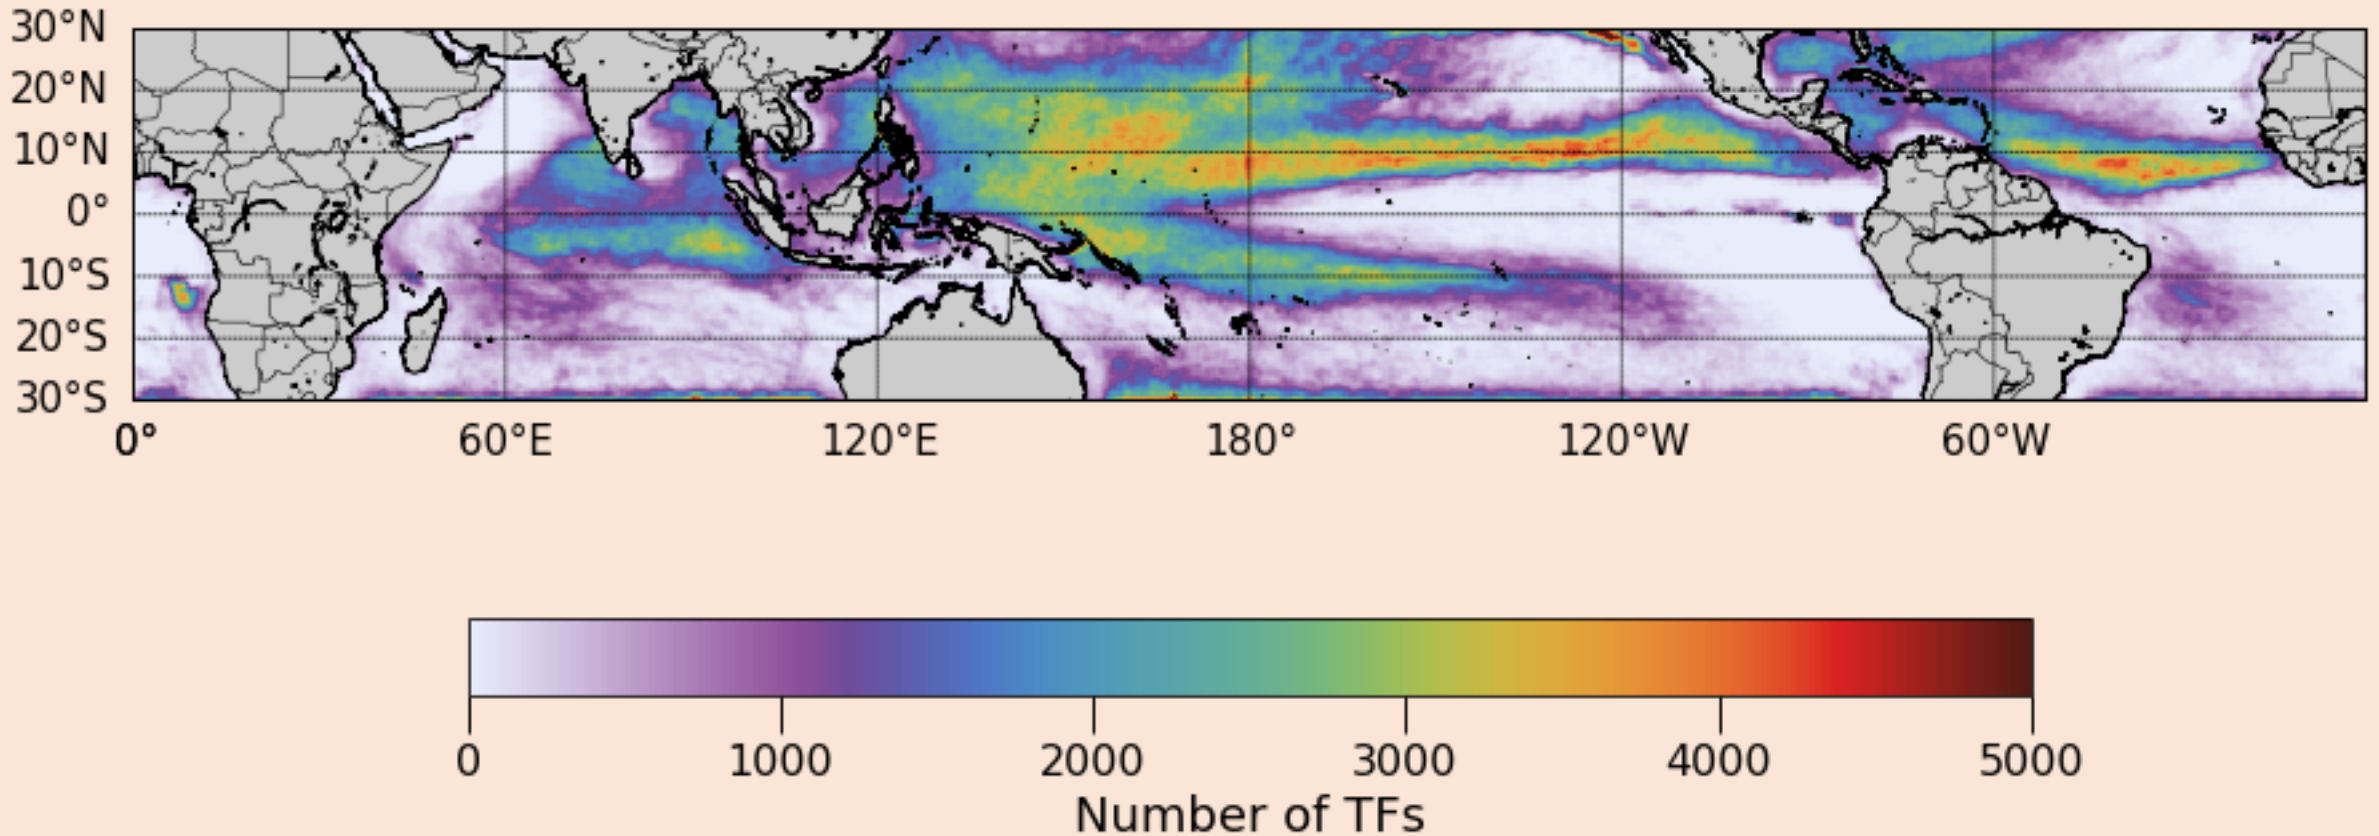

0-300 hPa Wind Shear

RH

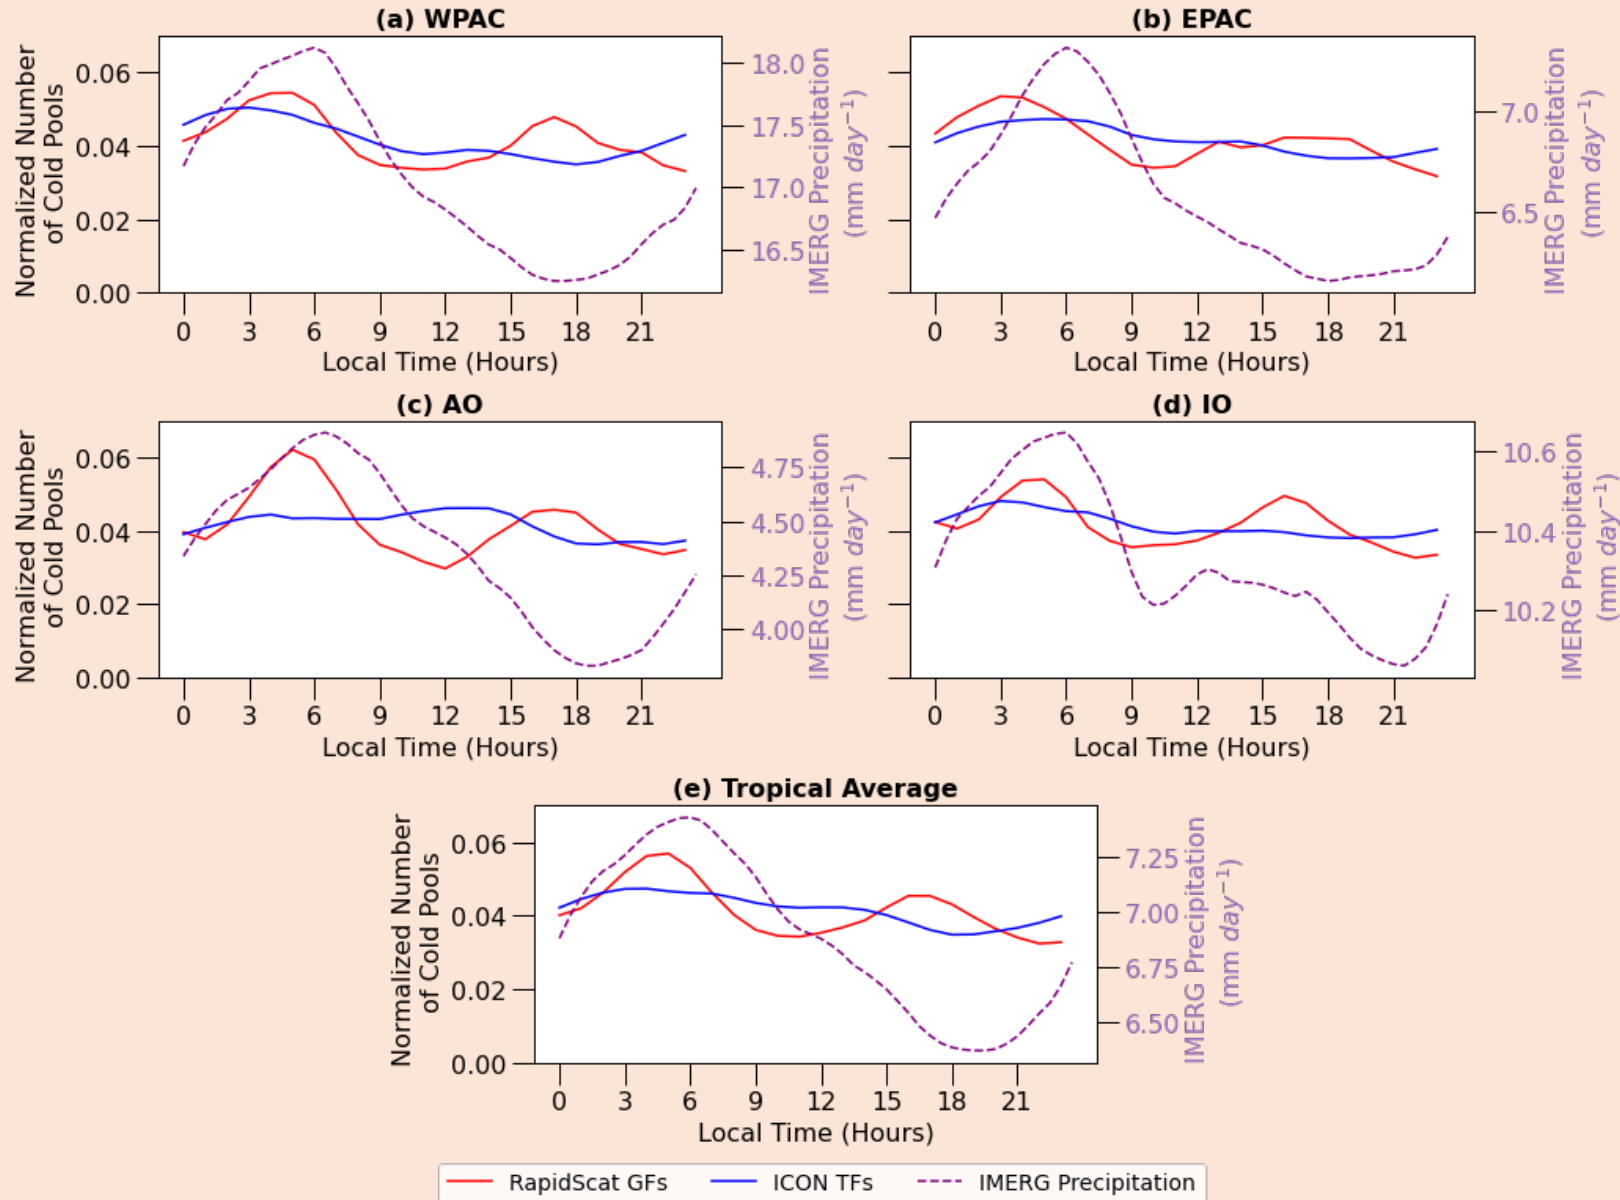

Precipitation

Summary

Model Simulated Cold Pool Climatologies are highly insightful in understanding cold pool-environment relationship.

ICON Cold Pool Number Diurnal Cycle Misses the Afternoon Cold Pool Activity Observed from RapidScat GFs

Cold Pool-Environment Relationship differs from basin to basin and needs to be carefully analyzed.

Thank You!!
