

Monitoring snow processes in the Ötztal Alps (Austria) and development of an open source snow model framework

Michael Warscher, Florian Hanzer, Carsten Becker, Ulrich Strasser

Continuous observations of snow cover properties at three high-alpine climate stations

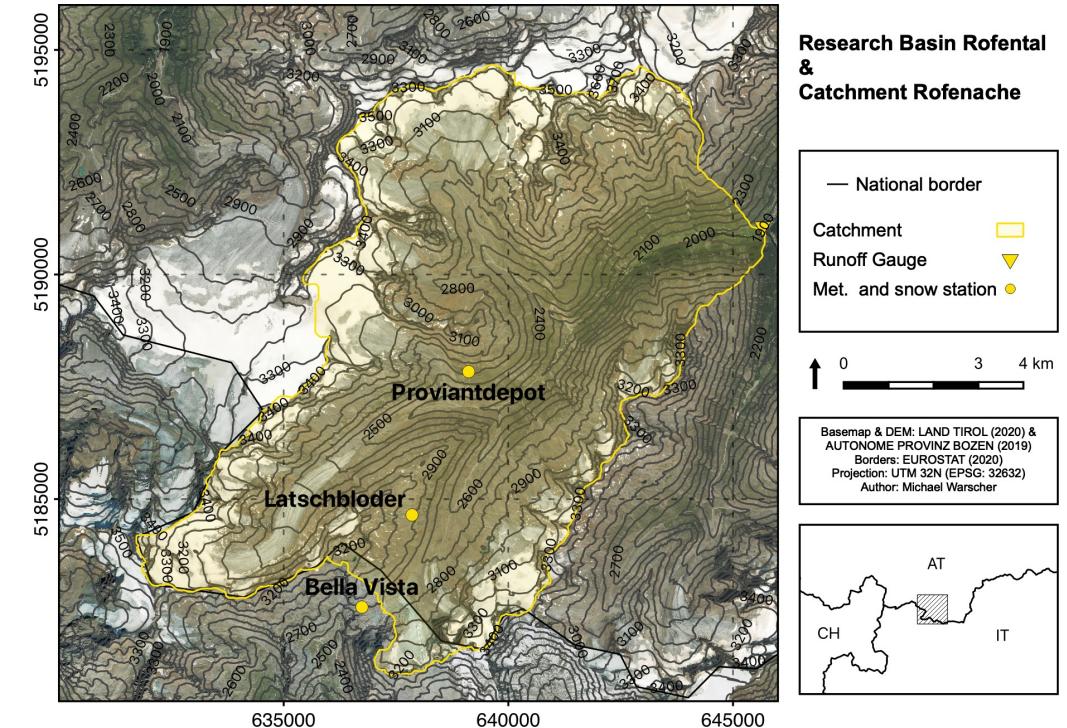

10-min. recordings of meteorological variables

- temperature, humidity, air pressure, wind speed and direction, SW/LW radiation (in and out), precipitation

AND snow variables

- snow depth (SD)
- snow water equivalent (SWE)
- snow surface temperature
- layered snow temperature profile
- snow drift: acoustic sensor and experimental setup with two nearby SD and SWE measurements
- liquid / solid water content (SPA)
- snow density (SWE/SD and SPA)

Complementing and continuing a large data collection

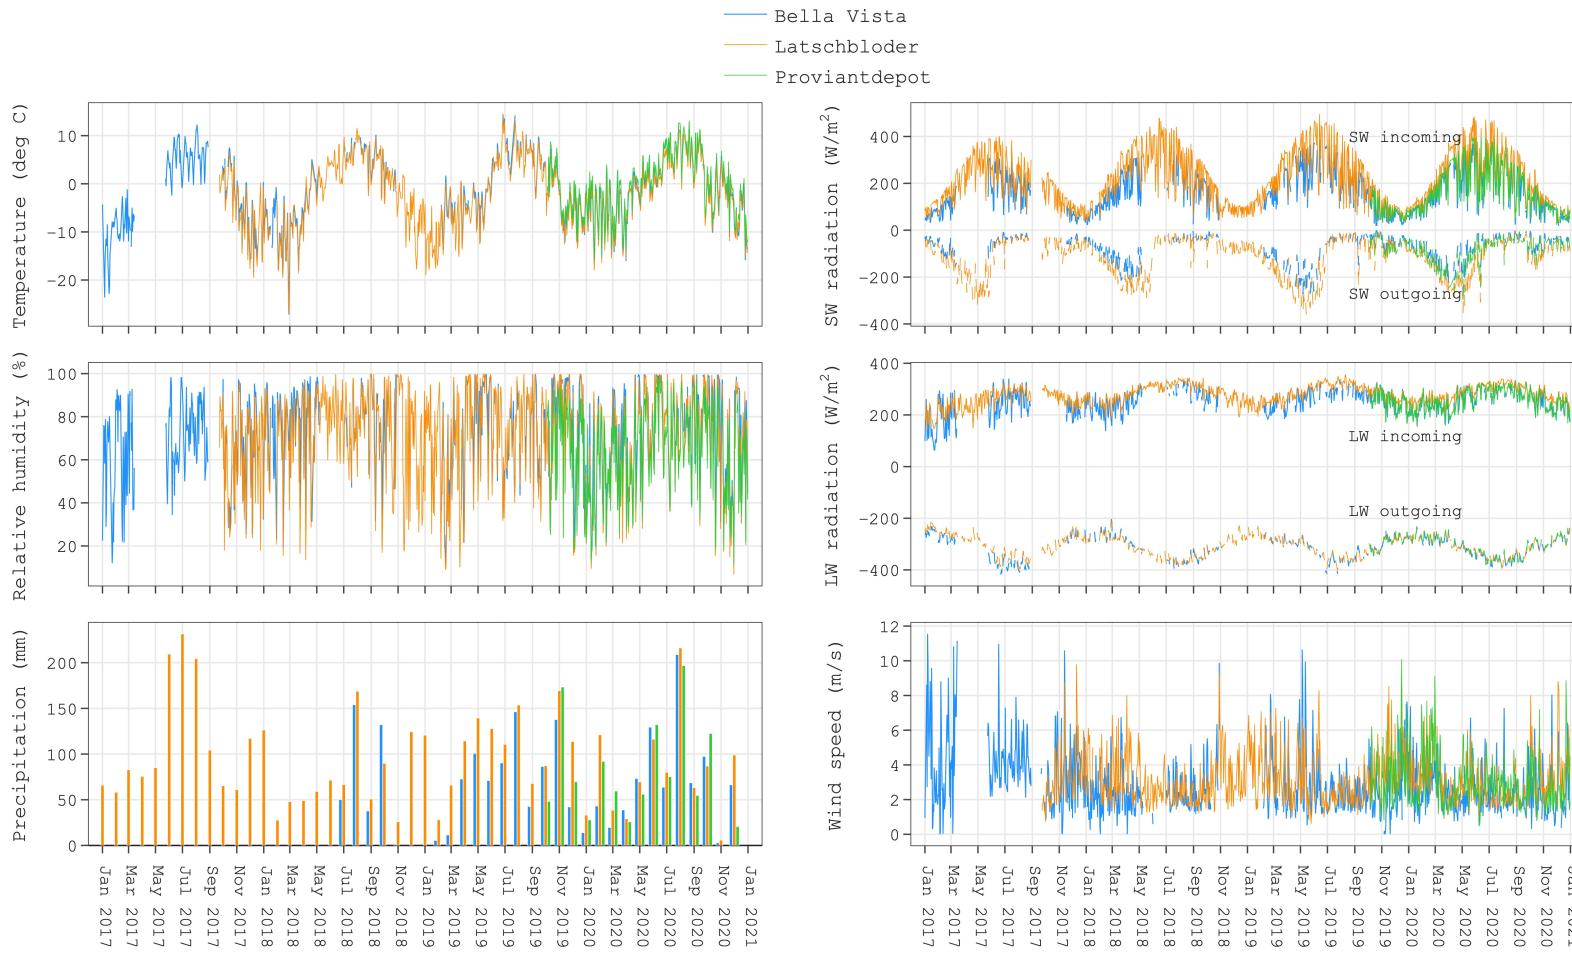

Research Basin Rofental in the Ötztal Alps (1.890 to 3.770 m a.s.l., 98.1 km²), monitoring activities since 1884 by many people and institutions (documented in Strasser et al. 2018 and Warscher et al. 2021)

Large, curated data collection available at <https://www.pangaea.de/?q=%40ref104365> and <https://doi.org/10.1594/PANGAEA.876120>

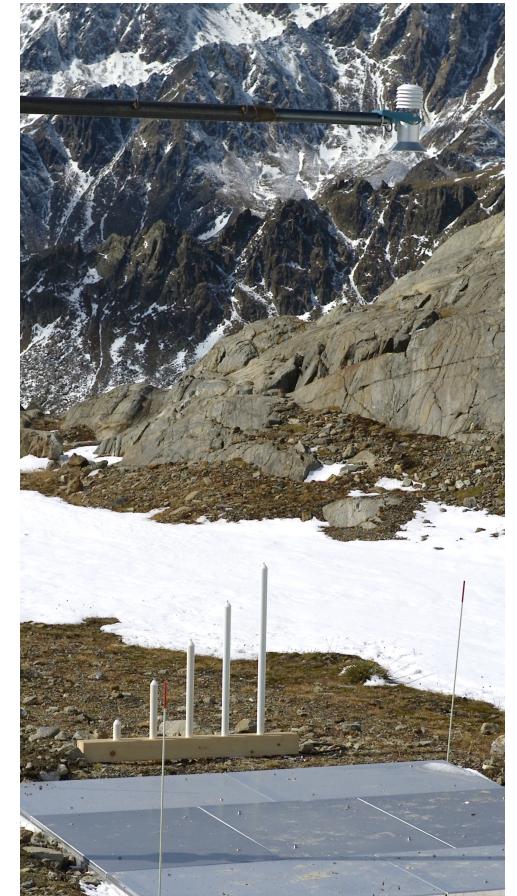

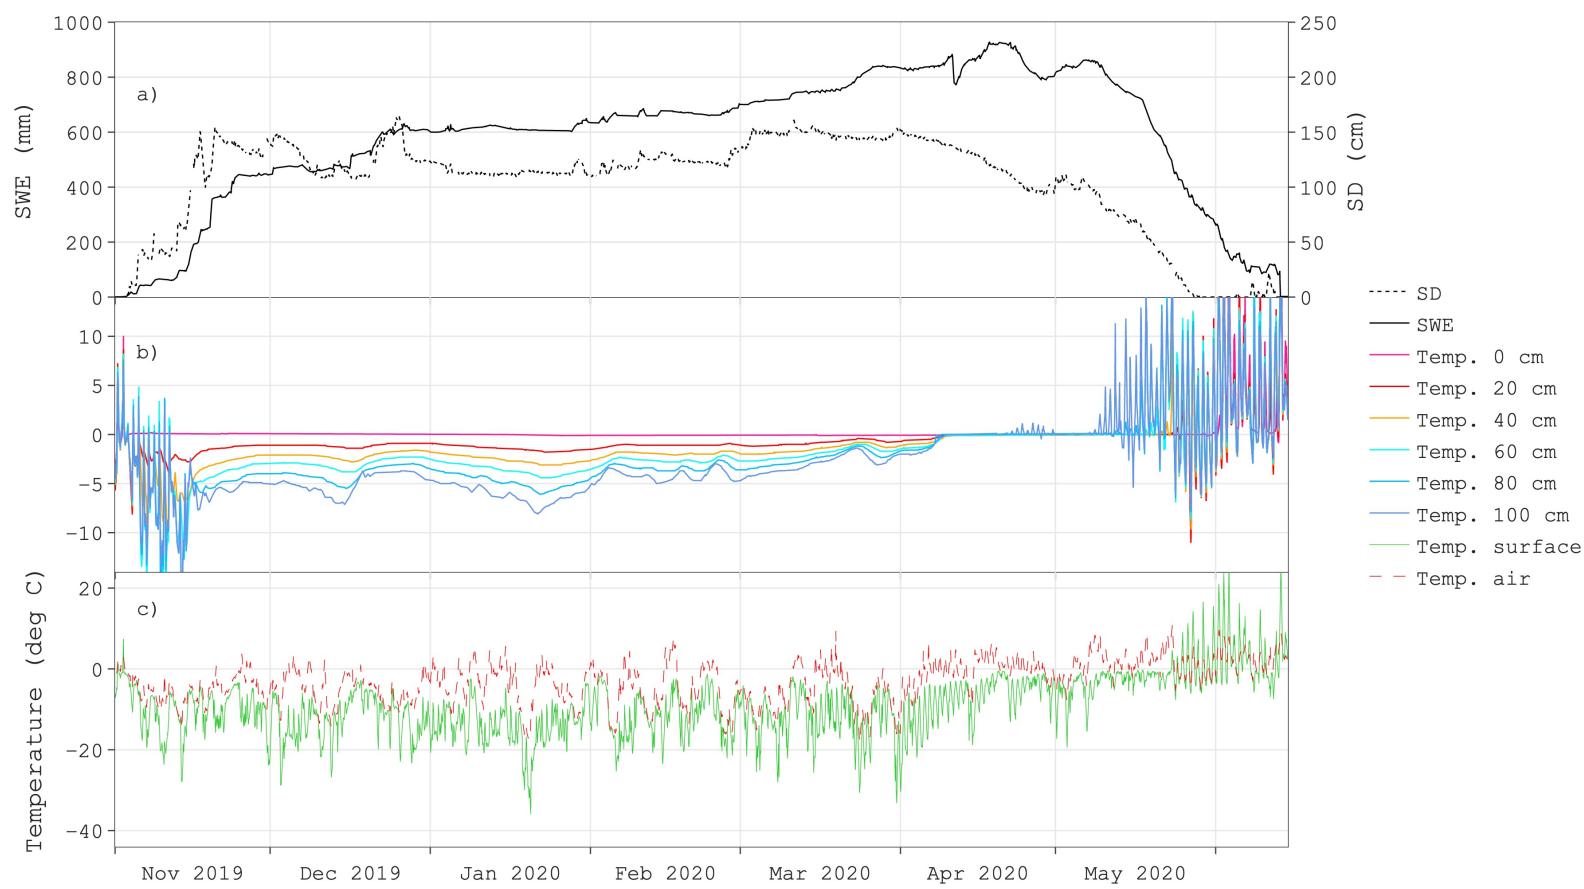

Part of international research initiatives

- UNESCO IHP <http://en.unesco.org/themes/water-security/hydrology>
- GEWEX INARCH <https://www.usask.ca/inarch/>

Meteorological data (temperature, humidity, precipitation, wind speed, short- and longwave radiation)

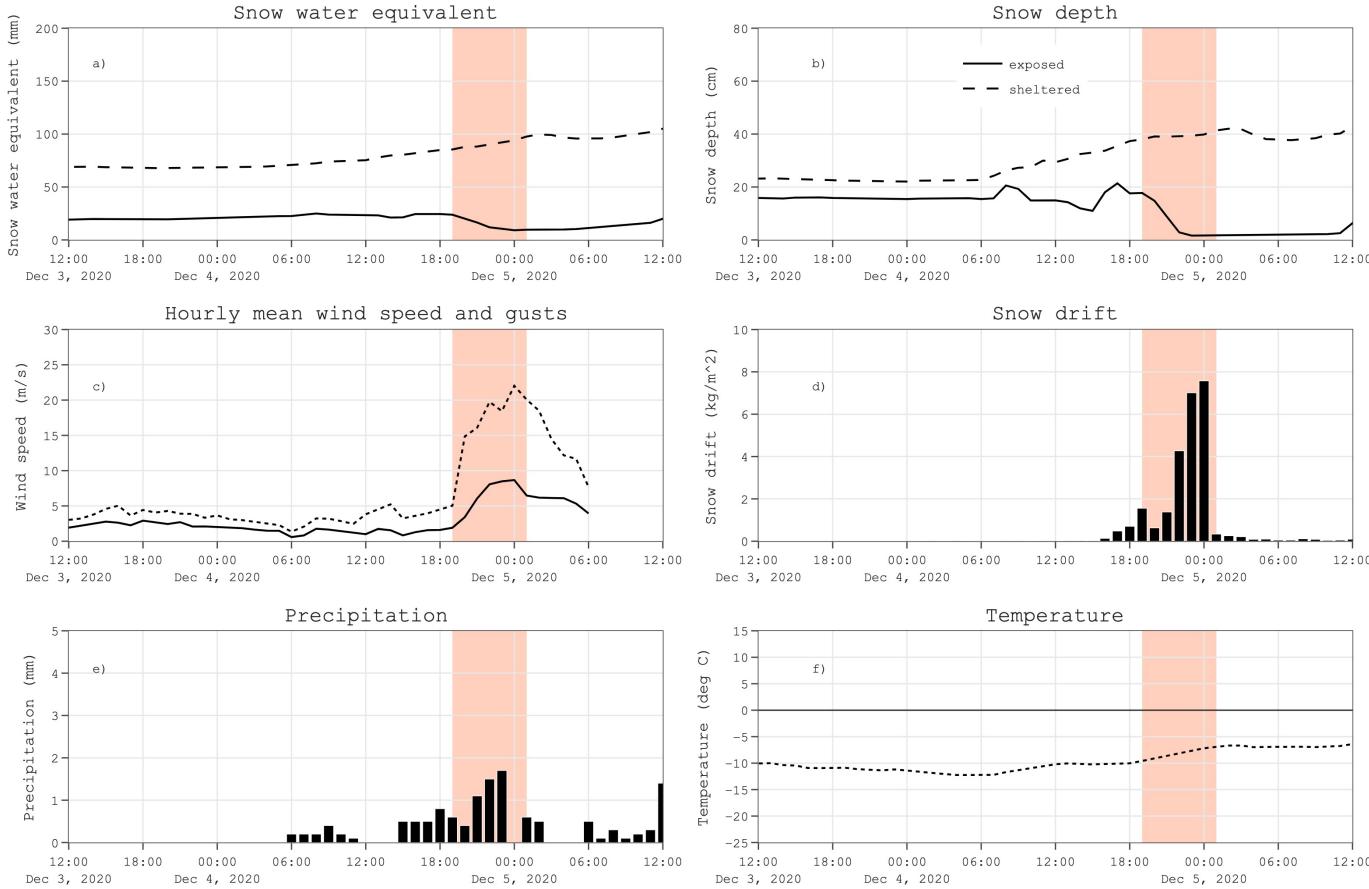

SWE, SD, snow temperature profile, air and surface temperature

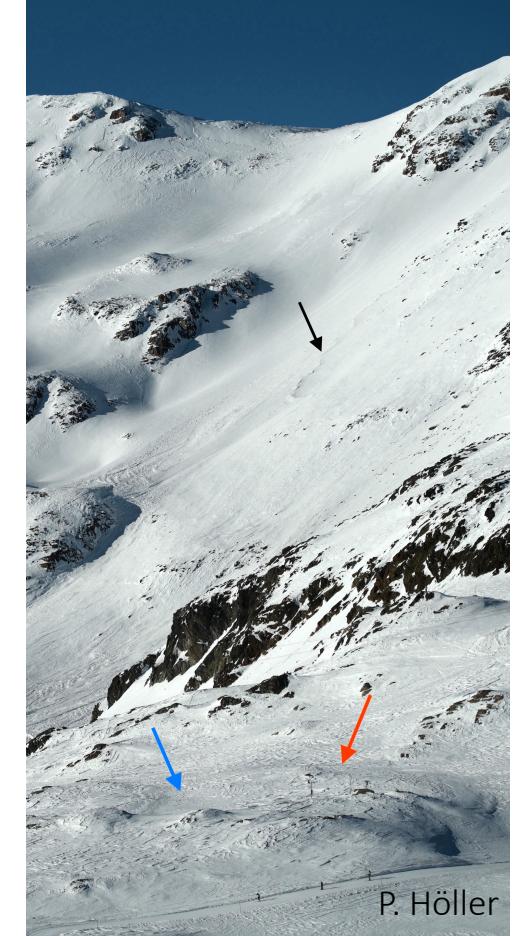

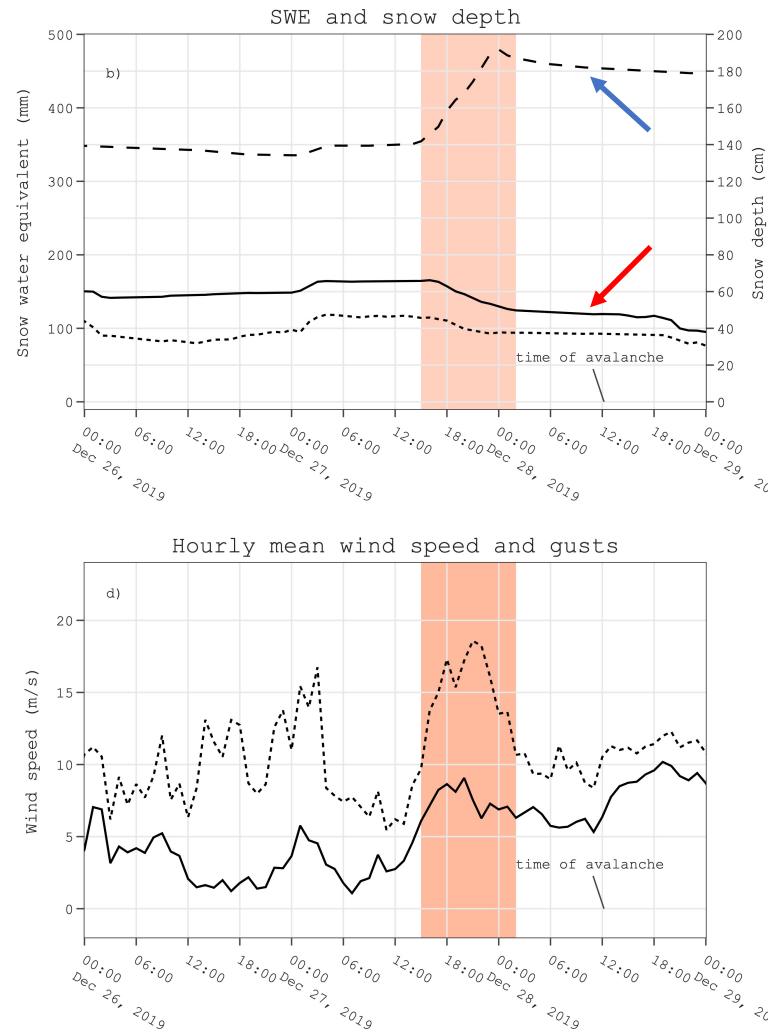

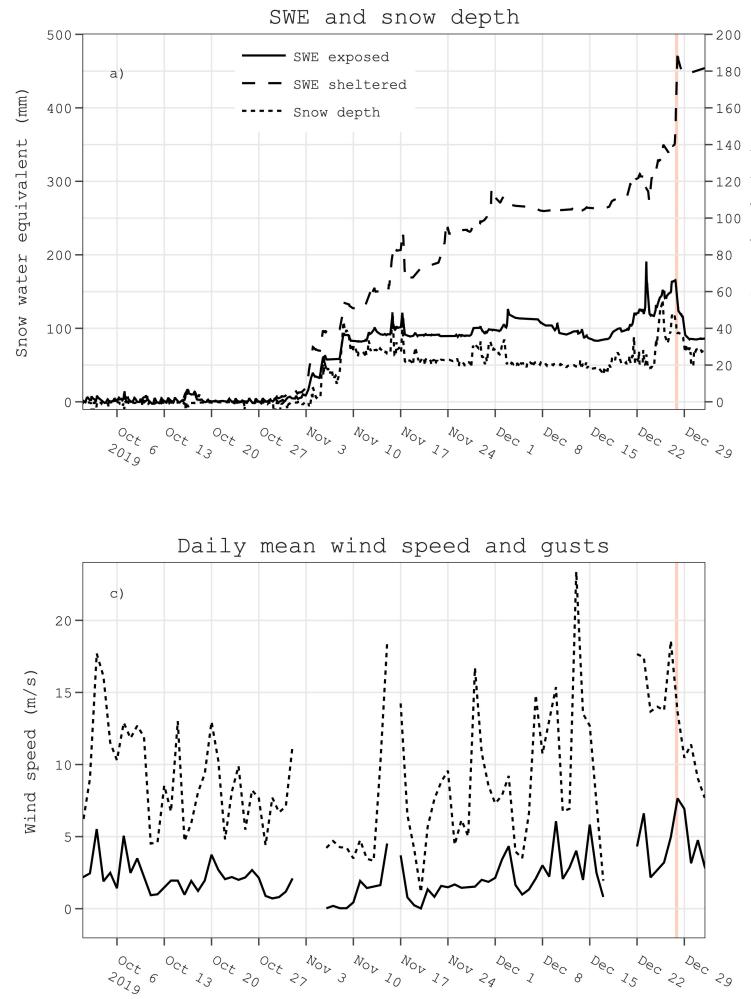

Liquid / solid water content, snow density (Snow Pack Analyzer)

Wind-driven snow redistribution (acoustic sensor and double SD and SWE measurement)

Avalanche Dec. 2019 (observation of nearby snow redistribution)

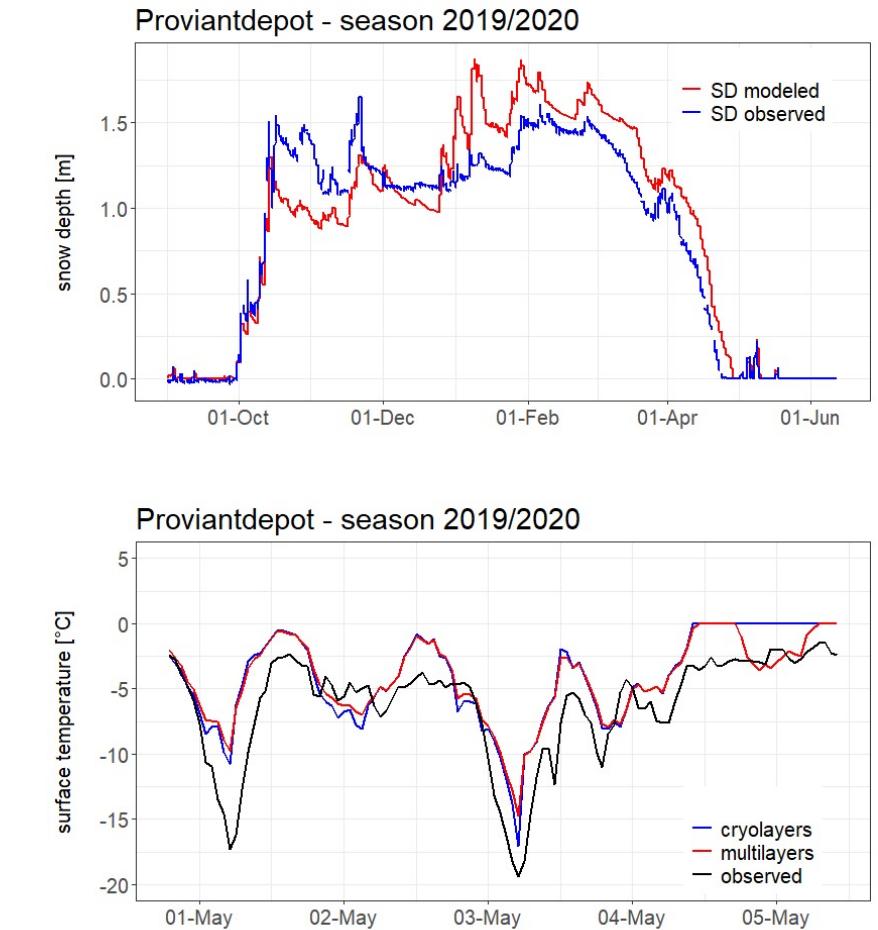

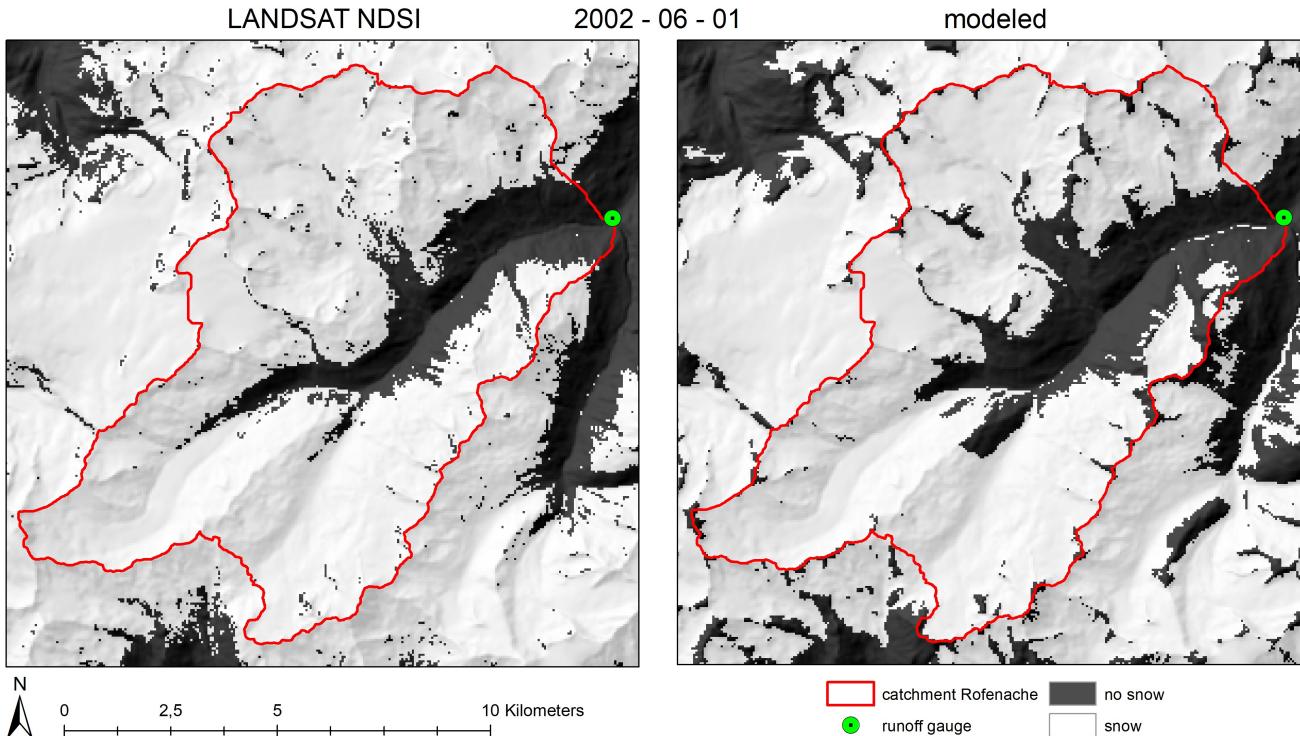

Open source snow and hydroclimatological modeling framework “openAMUNDSEN”

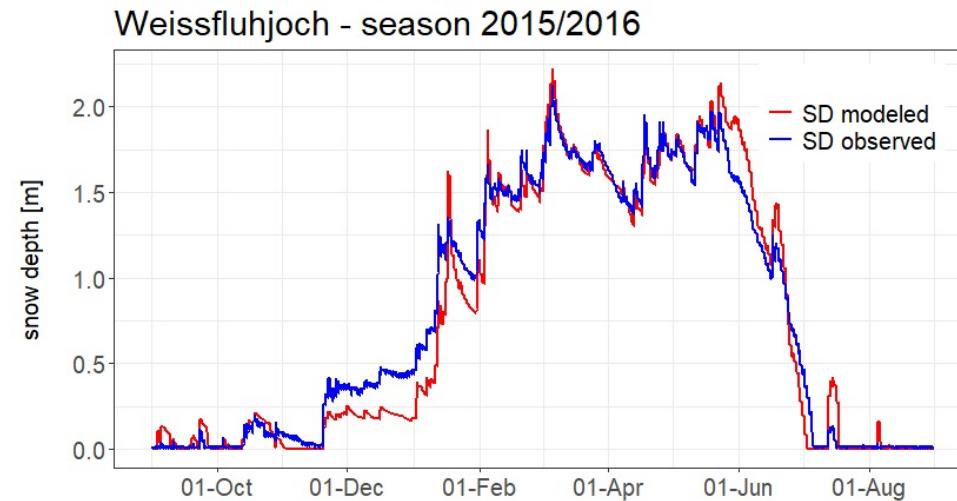

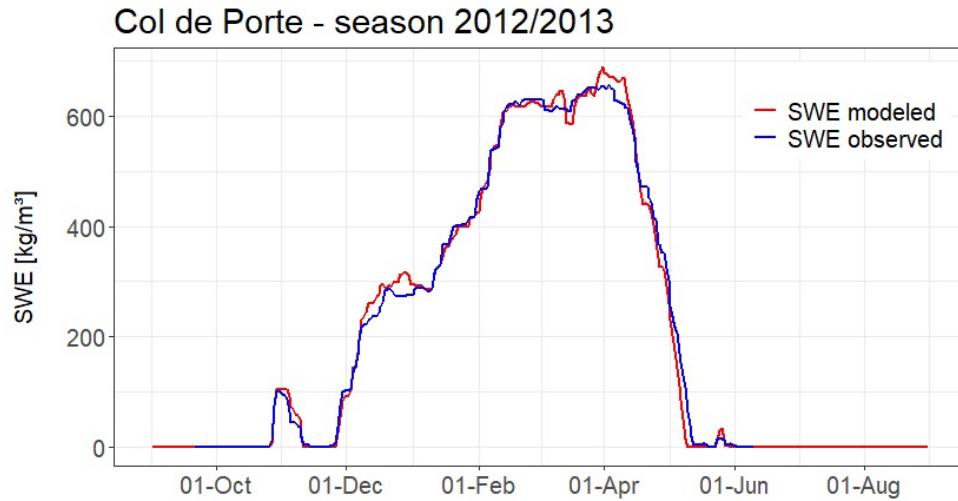

openAMUNDSEN = newly developed, open source version of AMUNDSEN

- spatially distributed, physically based model for the simulation of the mountain snow cover (accumulation, redistribution, ablation) and hydrology from meteorological observations and model outputs
- developed since 2001, many projects and publications (<https://www.uibk.ac.at/geographie/mus/>)
- validated in many alpine catchments (resolutions: 5 m to 1 km, 1 h to 1 d)
- took part in SnowMIP, SnowMIP2, and ESM-SnowMIP
- process descriptions of: spatial redistribution of meteorological forcing, radiation modeling, inside canopy micrometeorology, snow-canopy interaction, lateral snow redistribution (wind / gravitation), albedo ageing, snow density, liquid water content, cold content, different schemes for snow pack/surface energy balance (“cryolayers”, “multilayer”), option for T-Index, etc.
- completely rewritten in a modular python structure
- now open source and publicly available at: <https://github.com/openamundsen/openamundsen>

openAMUNDSEN – Validation Rofental data

openAMUNDSEN – Validation ESM-SnowMIP data

Thank you for your interest!
