Climate change impact on rain, snow and glacier melt components of streamflow for the River Rhine: synthesis of a model experiment and relevance for water use

Please read & cite the following report, avail. at www.chr-khr.org from 1 June 22

Stahl, K., Weiler, M., van Tiel, M., Kohn, I., Hänsler, A., Freudiger, D., Seibert, J., Gerlinger, K., Moretti, G. (2022): Impact of climate change on the rain, snow and glacier melt components of streamflow of the river Rhine and its tributaries. CHR report no. I 28. International Commission for the Hydrology of the Rhine basin (CHR), Lelystad.

The model approach

Daily meteorological data at stations (1974-2019)

RCM/GCMs (1974-2100)

Multi-variate bias correction

Spatial interpolation of the meteorological input

Rain

Snow

Hydrological models

Glacier change model

Q_{rain} Q_{snow} Q_{ice}

daily Q

Transient Runs!

Observations (1974-2019)

Hindcast (1974-2019)

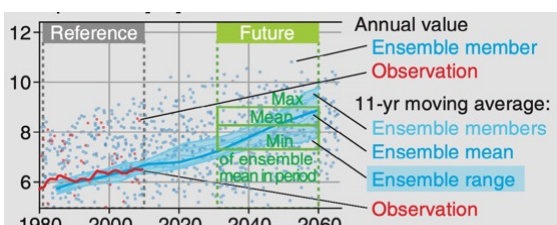

Climate scenario simulations (1974-2100)

Reference (1981-2010)

Near future (2031-2060)

Far future (2071-2100)

- RCP8.5
- 7-member ensemble (EURO-CORDEX: 5GCMs, 2 RCMs)

- Daily streamflow components for climate change scenarios
- Analysis: annual, seasonal, extremes & upstream to downstream

Conclusion

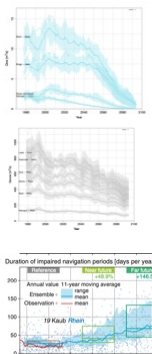

Model experiments indicate:

- declines in Q_{ice} and Q_{snow} with consequences for future summer drought situations
- compensation by the rain component downstream

➤ Summer use restrictions will exacerbate
