³ Stanford University, Stanford, USA

⁴ University of Arizona, Tucson, USA

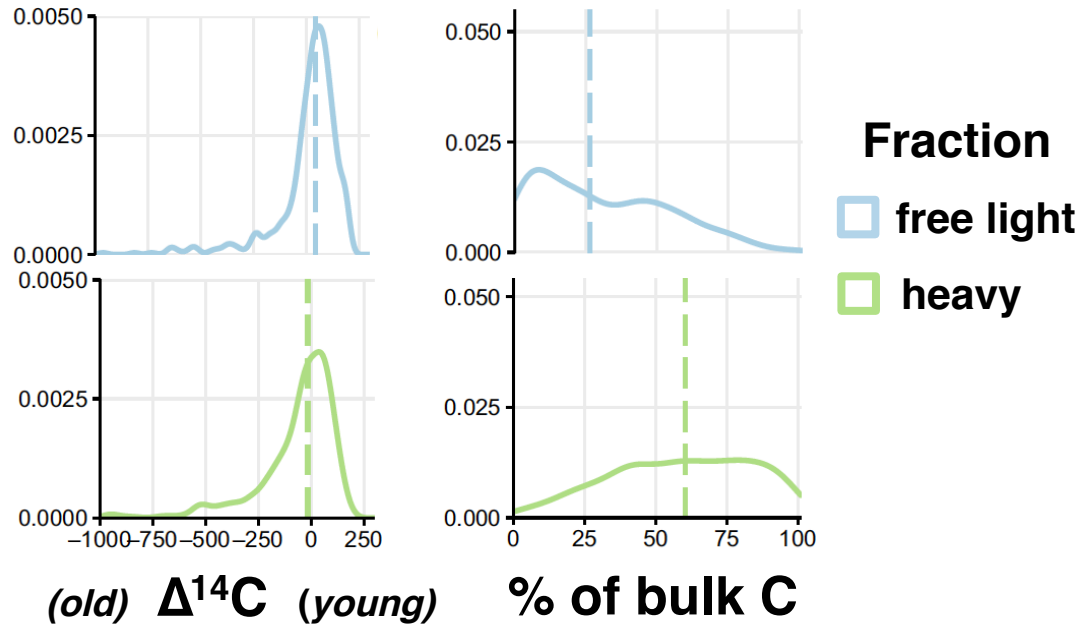

MOTIVATION

- Majority of soil C is mineral-associated (“heavy”)
- Some mineral-associated C very old
- Yet globally, heavy fraction C is surprisingly young

Global distribution of $\Delta^{14}\text{C}$ in fractions (<30cm) *(right)*

(Heckman & Hicks-Pries et al. 2021)

MOTIVATION

- Majority of soil C is mineral-associated (“heavy” C)
- Heavy C is more stable than light C

What controls
FAST (annual - decadal)

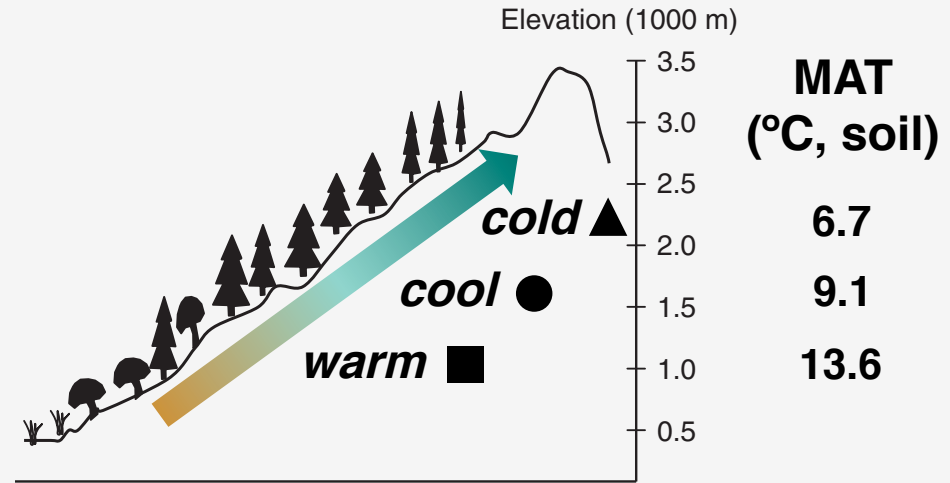

VS.

SLOW (centennial – millennial)
mineral-associated C?

Global distribution of soil C fractions
(Heckman & Parton 1997)

Light C
Heavy C

EXPERIMENTAL DESIGN

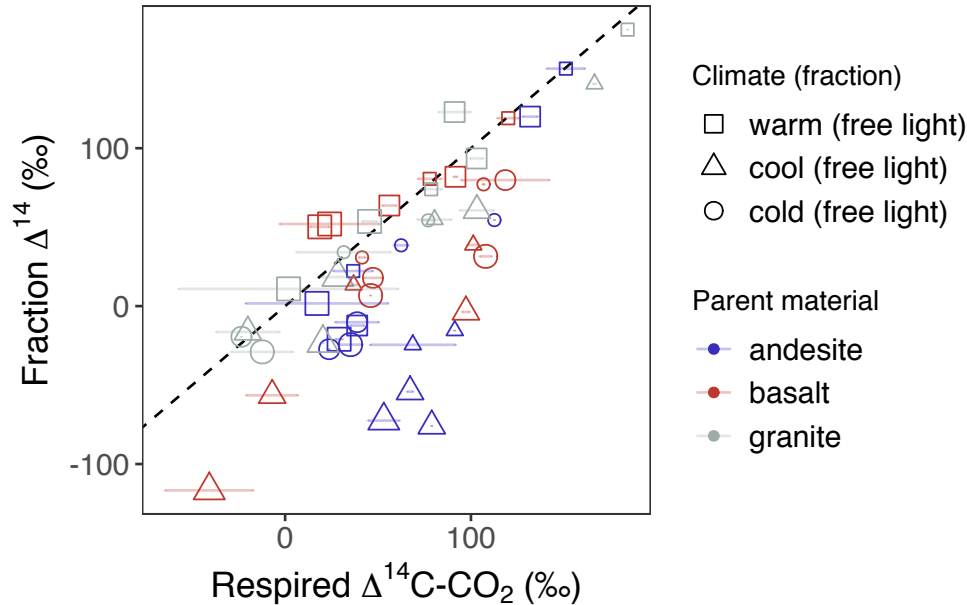

Sampled: 2001, 2009, 2019

Analyses: $\Delta^{14}\text{C}$, incubation, density & thermal fractionation

Results

FRACTION vs RESPIRED $\Delta^{14}\text{C}$

free light

*2001 & 2019 data;
point size increases with depth*

FRACTION vs RESPIRED $\Delta^{14}\text{C}$
