Distribution and sedimentation of microplastics in Taihu Lake

Zhang, Qiji, et al. "Distribution and sedimentation of microplastics in Taihu Lake." Science of The Total Environment (2021):148745.

Background

(tech.sina.com.cn)

(Xu et al., *Environ Sci Pollut R.*, 2020)

Definition of Microplastics (MPs): Plastic debris < 5mm

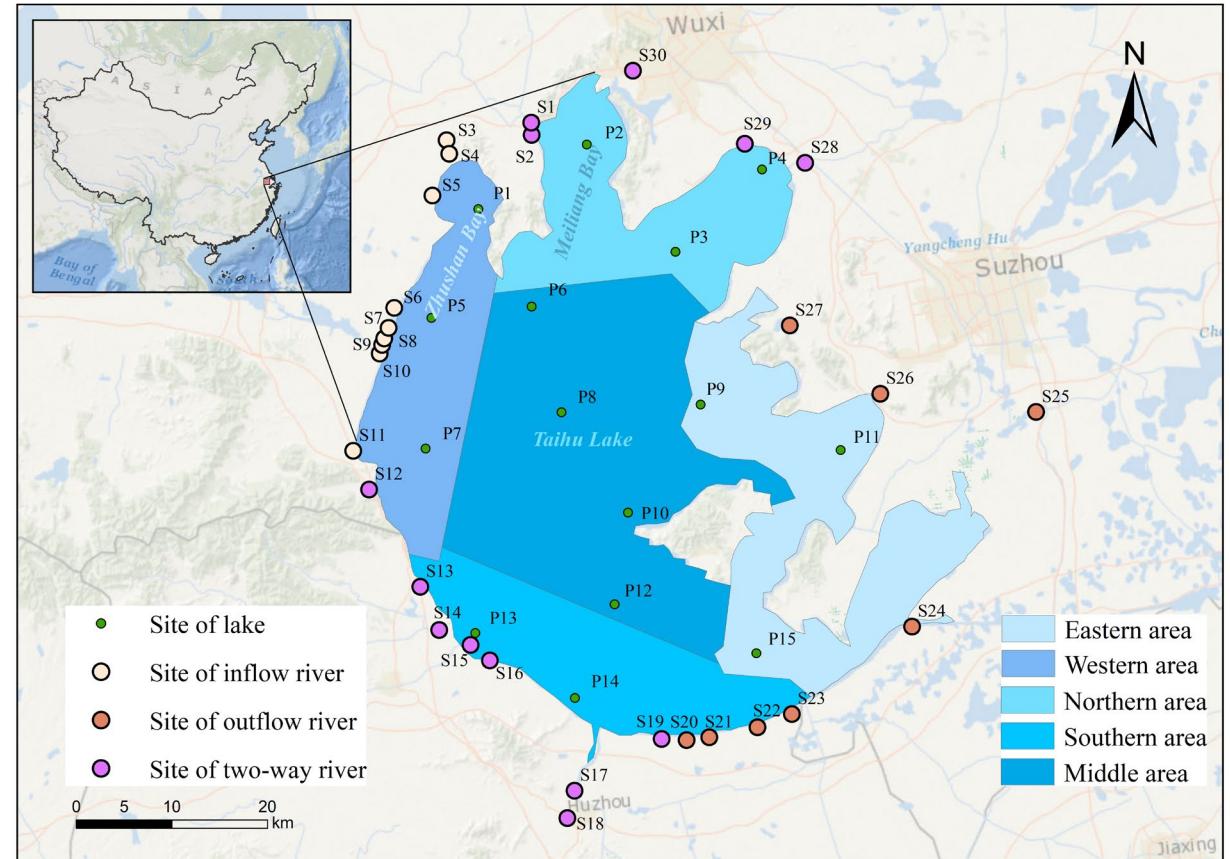

Classification of MPs: fragment, pellet, film, fiber, and foam.

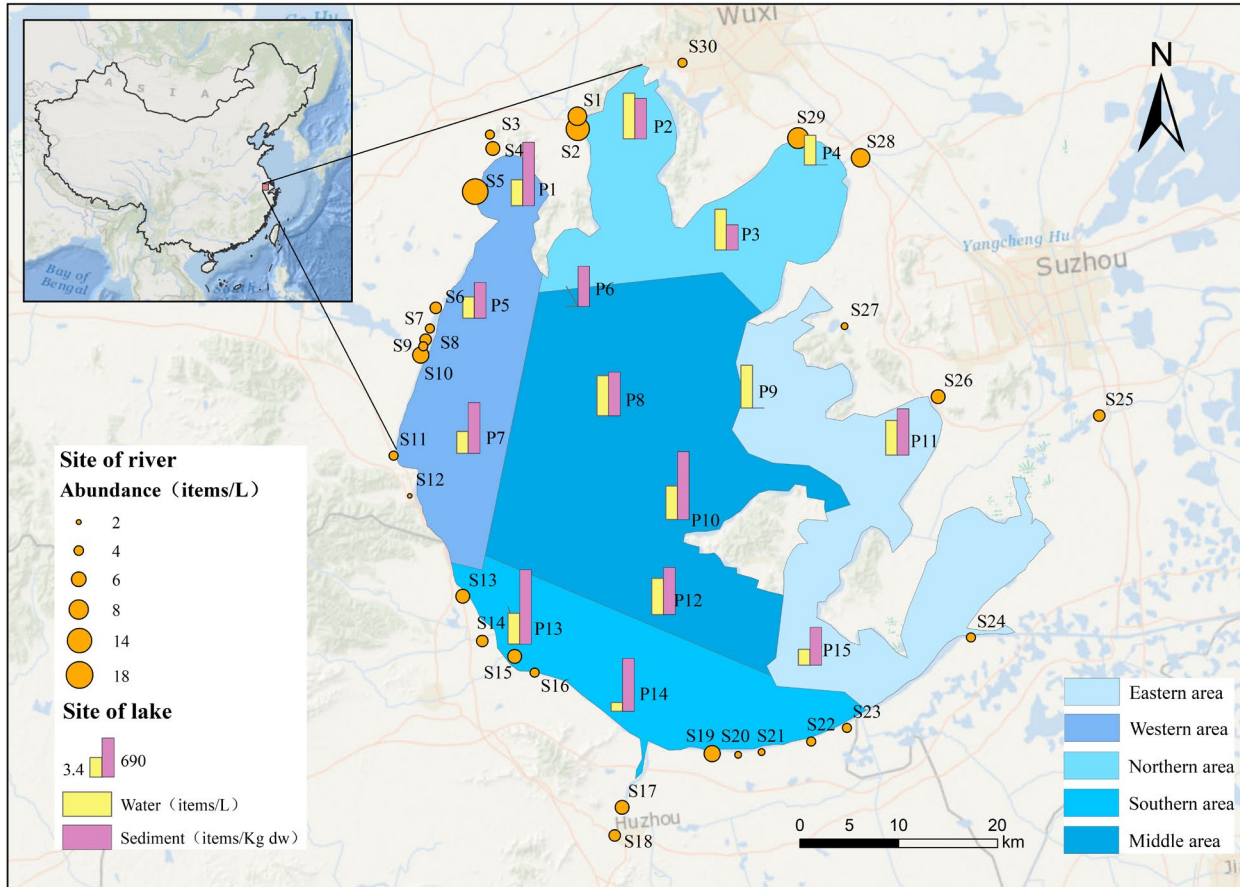

Survey area and sample treatment

- ◆ We surveyed the main **30 main rivers** around the lake and **14 sites in lake area**.
- ◆ We treated samples via wet peroxide oxidation, and filtered through 20 μm filter paper, then observed under a stereomicroscope.

Microplastics pollution levels in the Taihu Basin

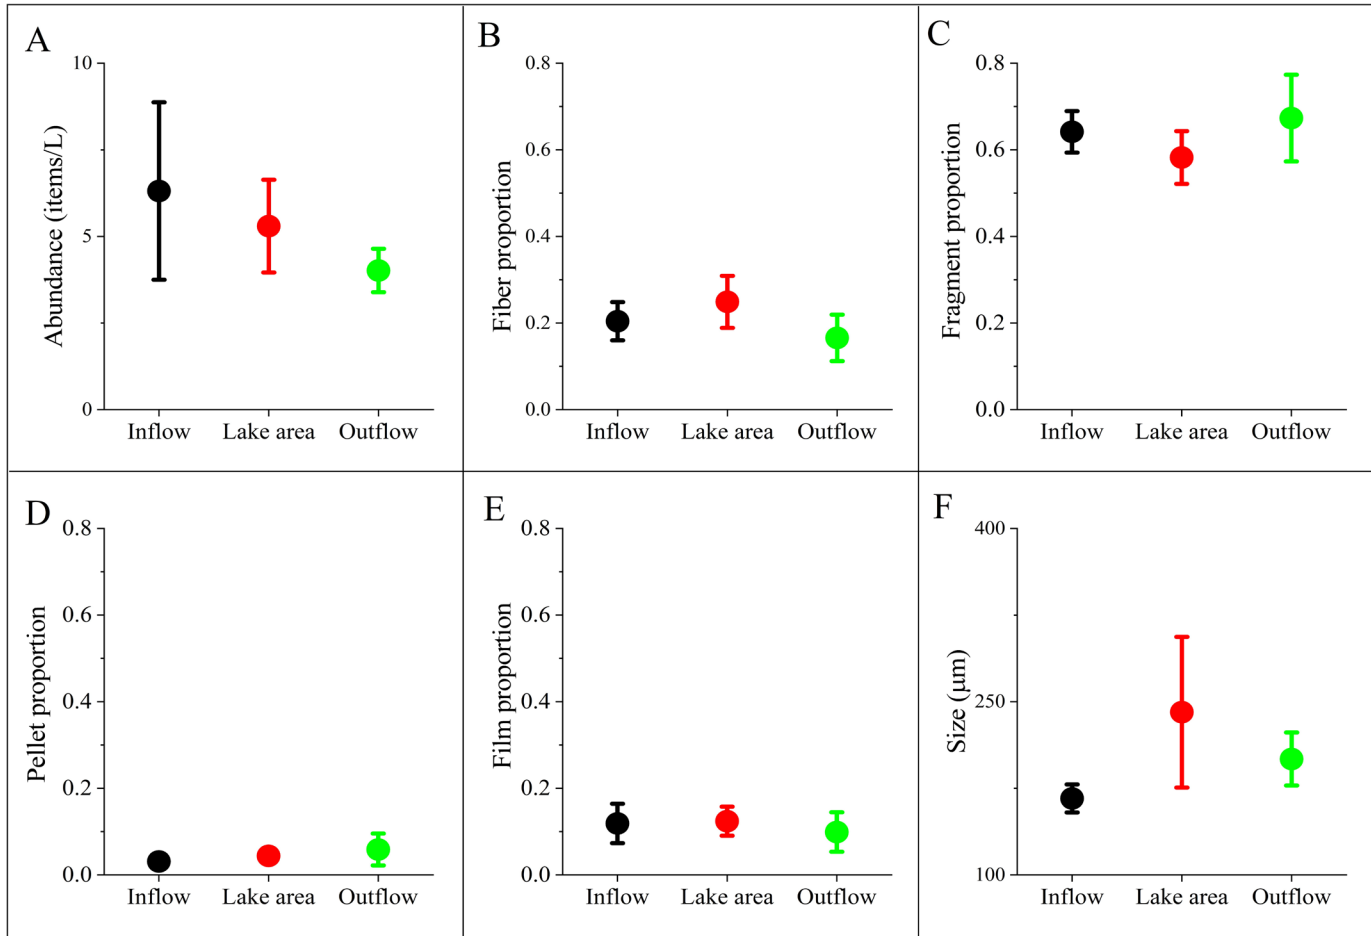

◆ The abundance of microplastics varied from 2-8 items/L in the surface water of the lake and from 2-18 items/L in the rivers.

◆ The abundance of microplastics in sediment varied from 464-1380 items/kg.

Comparison of microplastics in inflow and outflow rivers

◆ The average **concentrations** of **inflow** rivers were **higher** than that of **outflow** rivers.

◆ The **sizes** of microplastics in **outflow** rivers were **larger** than those in **inflow** rivers.

Microplastics distribution and characteristics in the lake

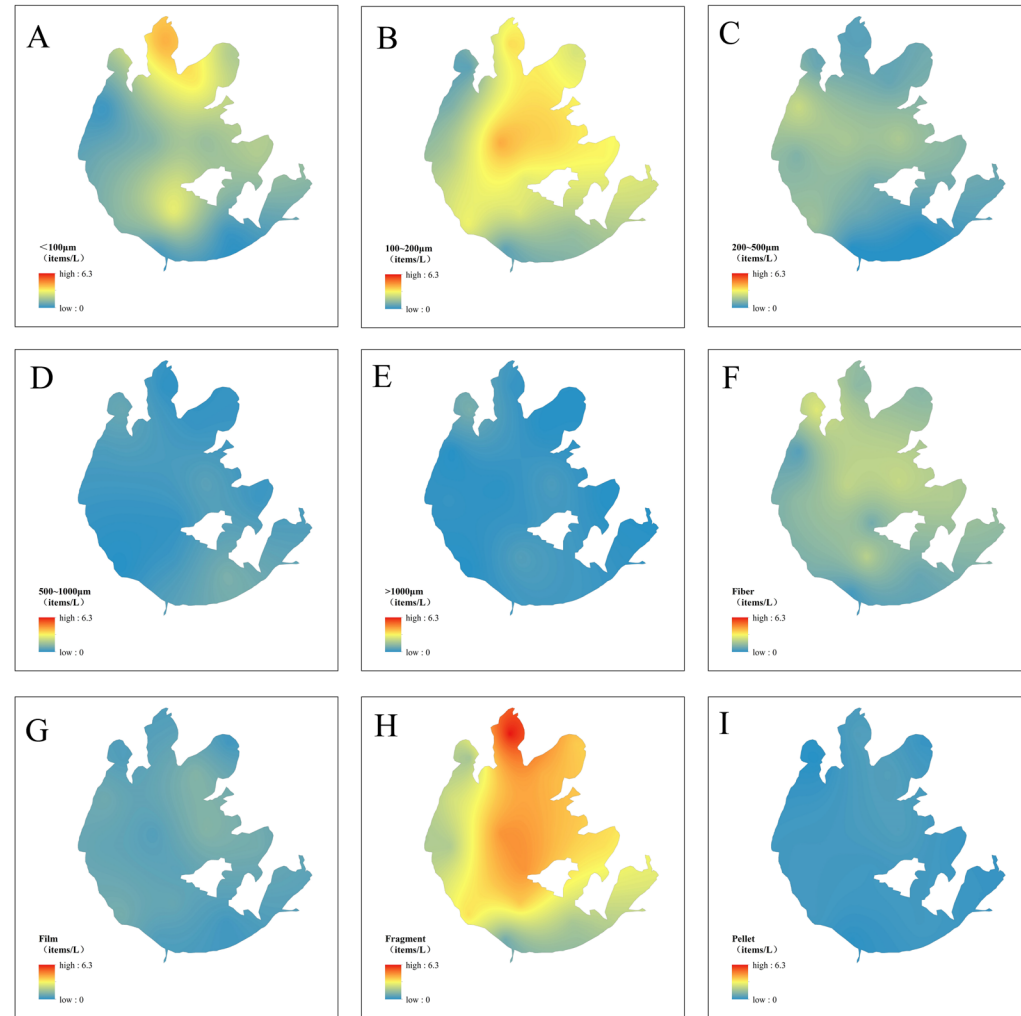

- ◆ The concentrations of microplastics in surface water were higher in the **northern, eastern and middle** part of the lake.
- ◆ Microplastics' distribution patterns in a large lake **differ from other pollutants.**

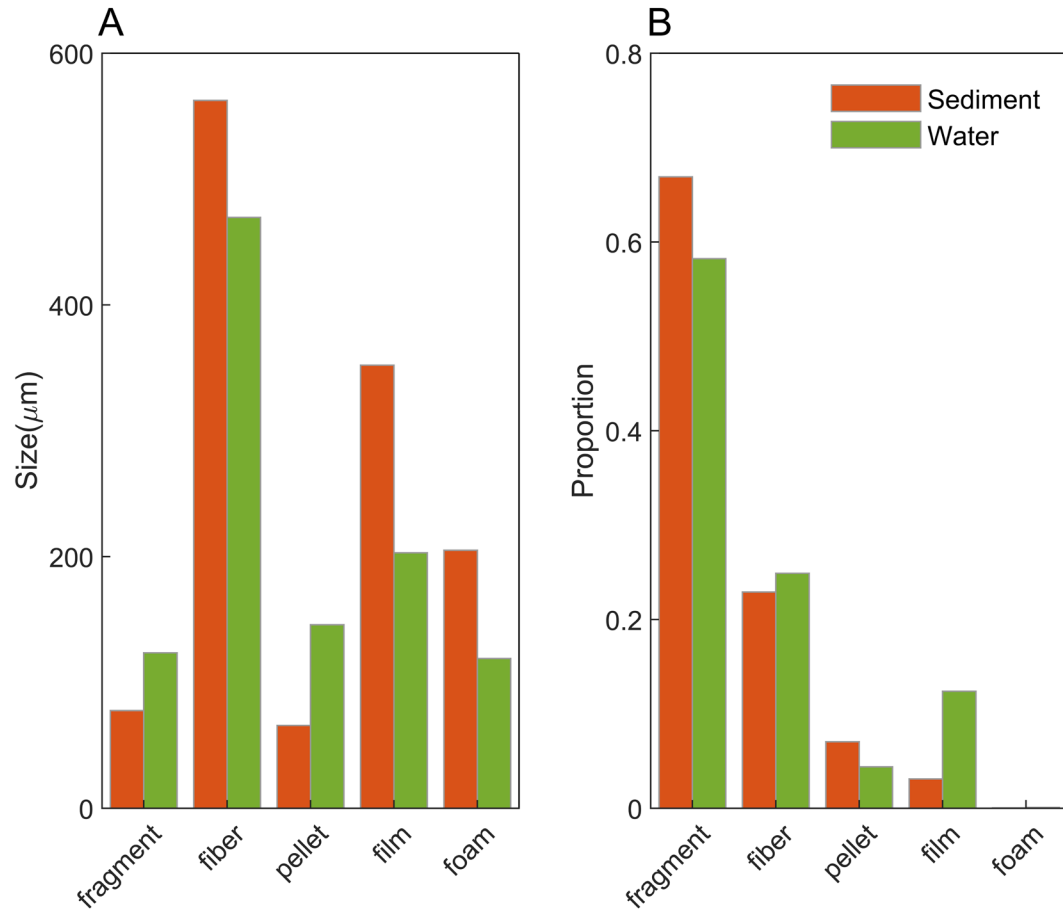

Microplastics distribution and characteristics in the lake

The **different distributions** of microplastics of different **sizes** (Fig. A–E) and **types** (Fig. F–I) resulted from interplay among pollutant sources, densities, etc.

Settling features

- ◆ The average size of **fragments and pellets** in **sediment** was **smaller** than that in surface **water**.
- ◆ Fragments and pellets accounted for more in **sediment** than in the **surface water**, indicating that **small fragments and pellets settled more easily**.

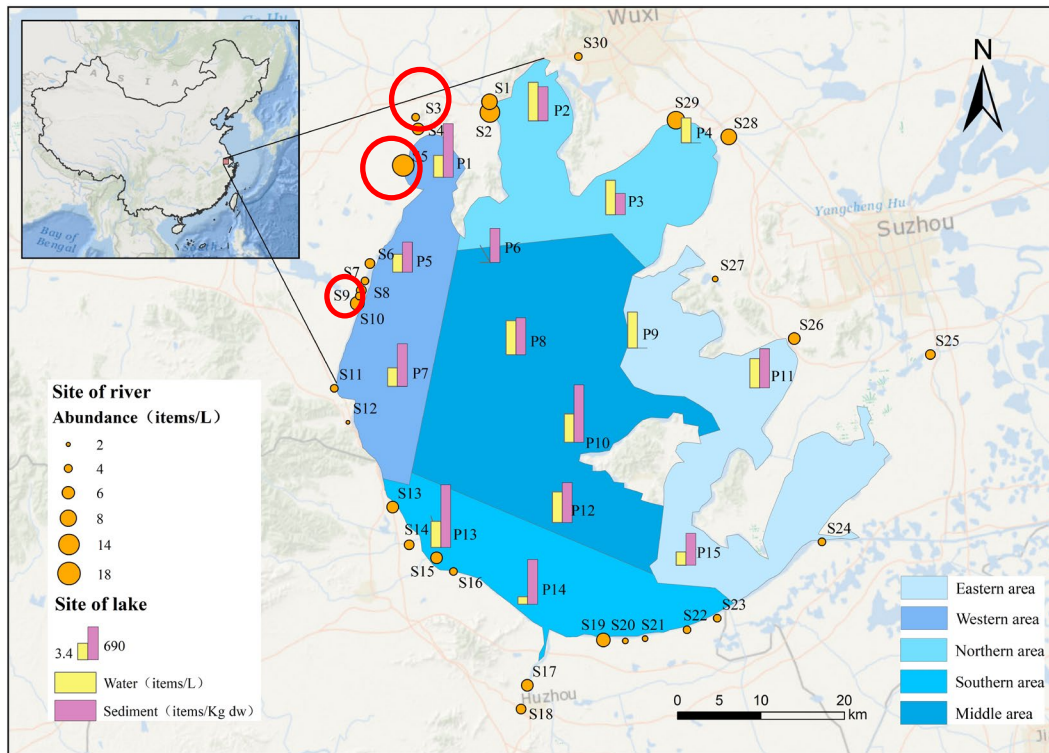

Microplastic flux

◆ Microplastics fluxes: 1.2×10^6 items/s

◆ River S3, S5, S9 and S10 accounted for 73% of the total inflow fluxes.

Location	Abundance (items/L)	Discharge (m ³ /s)	Flux (items/s)	Flux proportion
S1	8.46	1.29	10875	0.88%
S3	4.03	34.77	139929	11.37%
S4	5.73	0.66	3784	0.31%
S5	18.27	14.44	263727	21.42%
S6	5.05	6.27	31664	2.57%
S7	3.80	7.59	28823	2.34%
S8	4.69	9.74	45657	3.71%
S9	4.28	80.00	342667	27.83%
S10	7.24	21.37	154683	12.56%
S11	3.70	11.42	42236	3.43%
S15	6.13	4.00	24507	1.99%
S16	4.45	3.39	15086	1.23%
S17	6.21	5.82	36145	2.94%
S28	8.43	1.15	9689	0.79%
S30	3.75	21.80	81750	6.64%
sum		223.68	1231221	100.00%

Summary

- ◆ Inflow rivers were more polluted with microplastics compared with outflow rivers.
- ◆ The distribution patterns of microplastics in the lake differed from those of other pollutants.
- ◆ The small fragments and pellets settled most easily.

Thanks!
