@lucasvalore

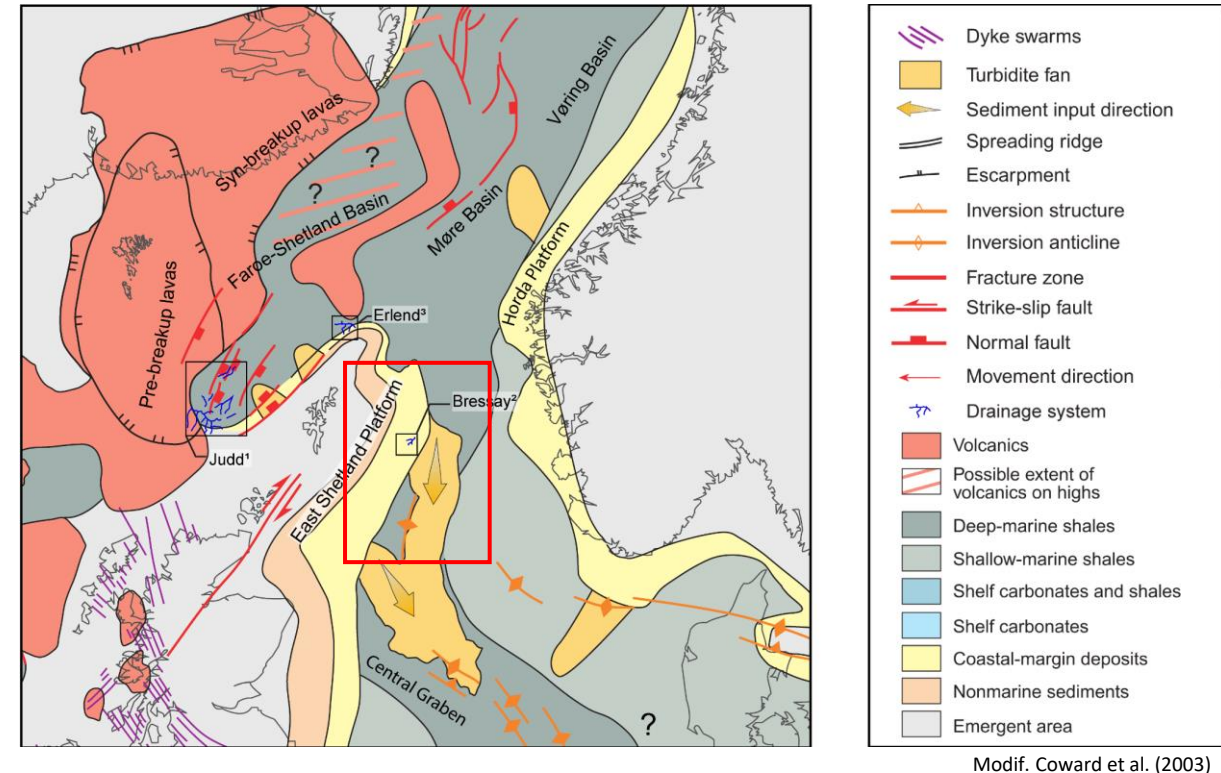

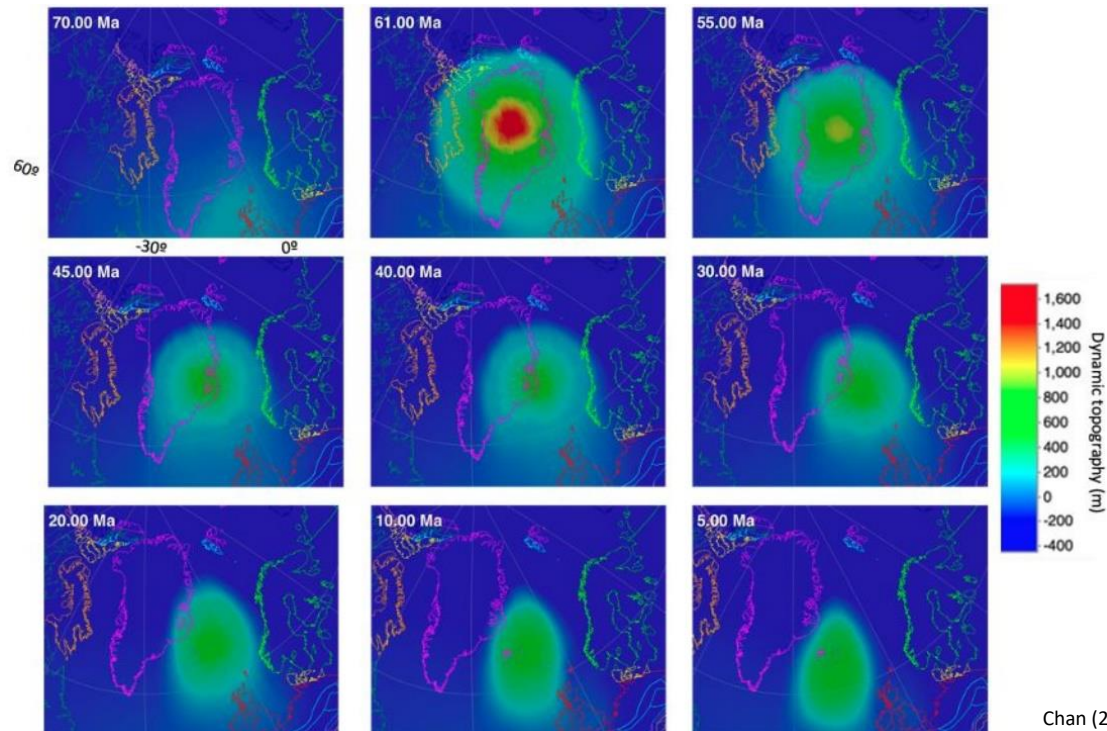

The project has received funding from the European Union's Horizon 2020 research and innovation programme under the Marie Skłodowska-Curie grant agreement No 860383.

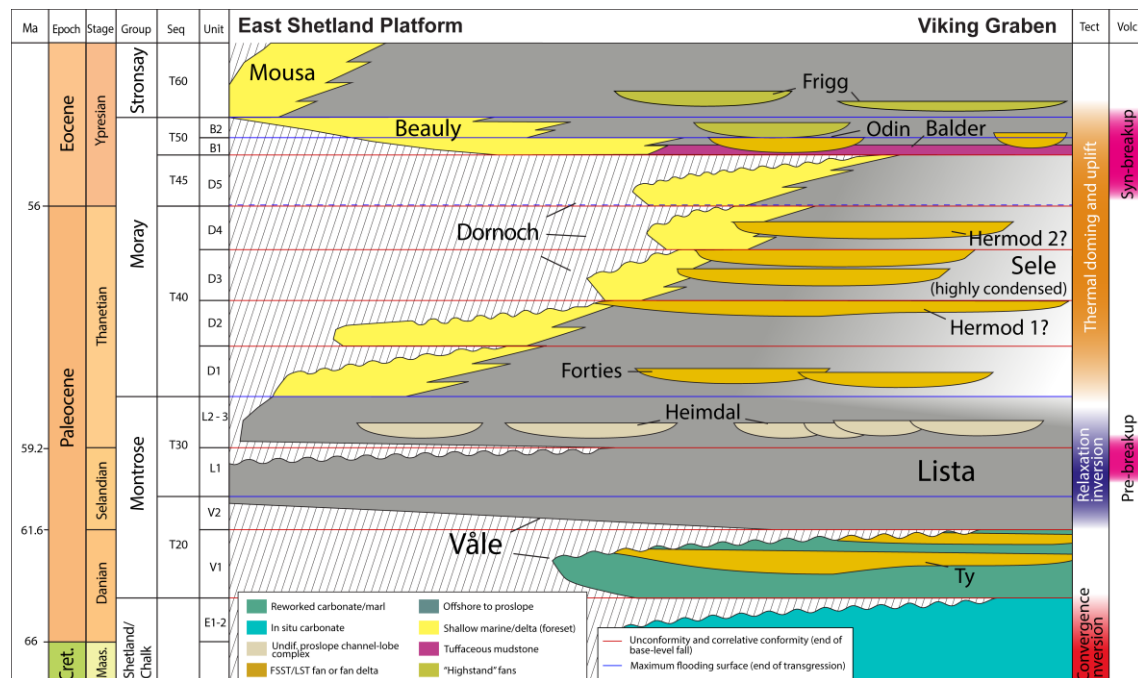

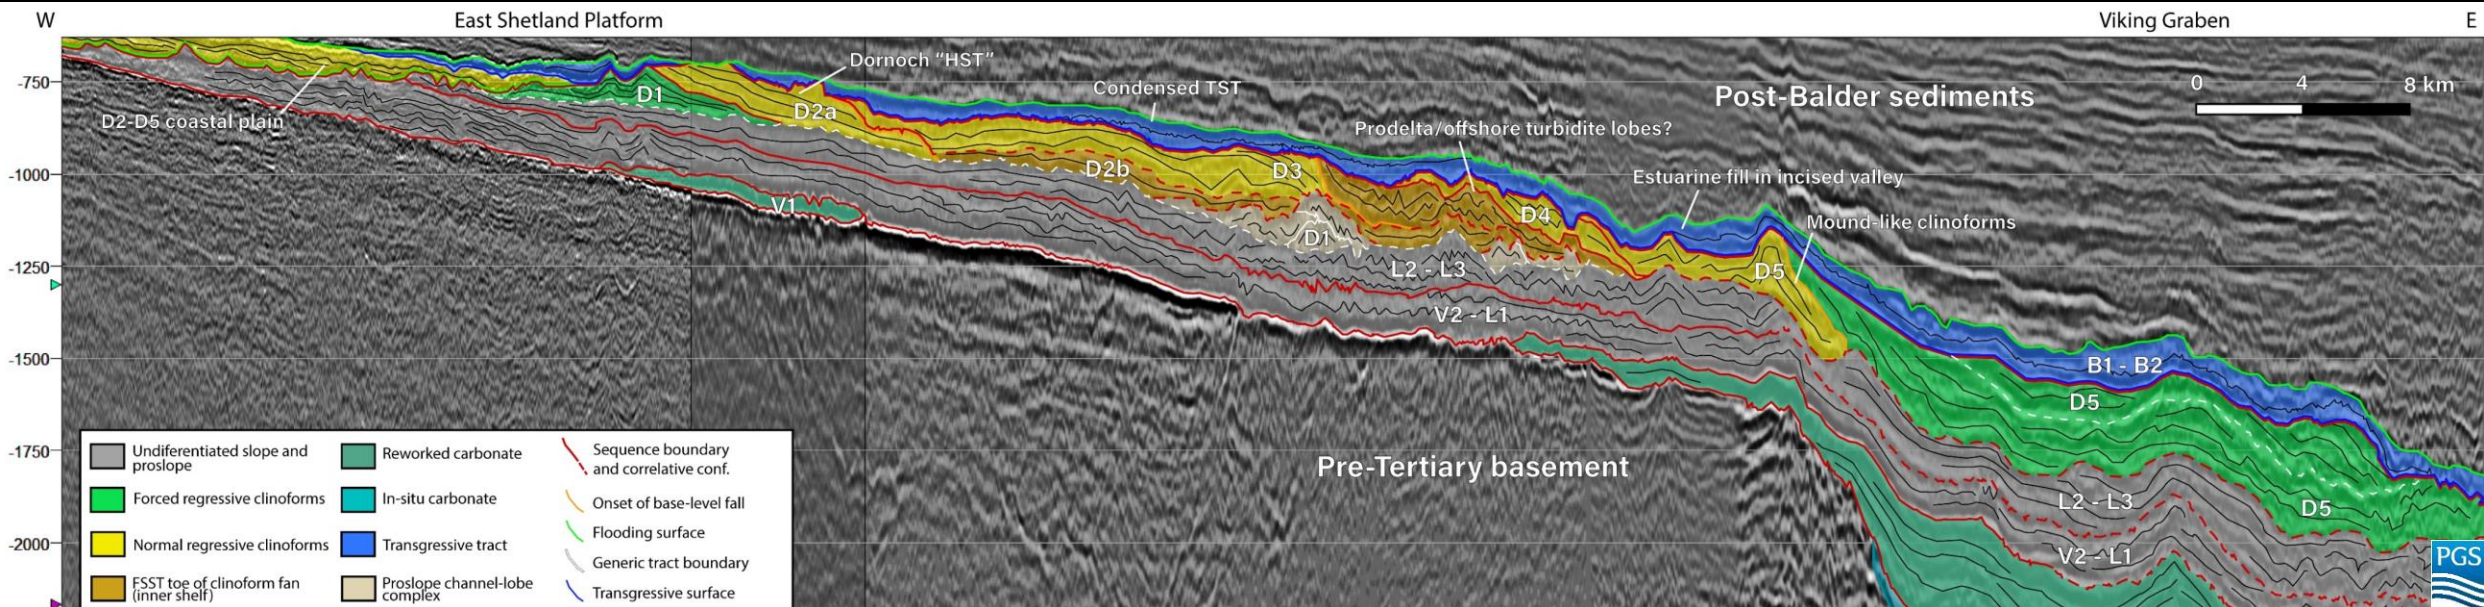

Research questions

HOW DOES MAGMATIC UPLIFT INFLUENCE SOURCE-TO-SINK SYSTEMS?

- Study area: **East Shetland Platform**, Paleocene – Eocene interval, or ~ **65 to 40 million years ago**
- Regional uplift due to **Icelandic Plume** – **not well understood**
- **Source-to-sink sedimentology** of LIP-influenced systems is not fully understood.

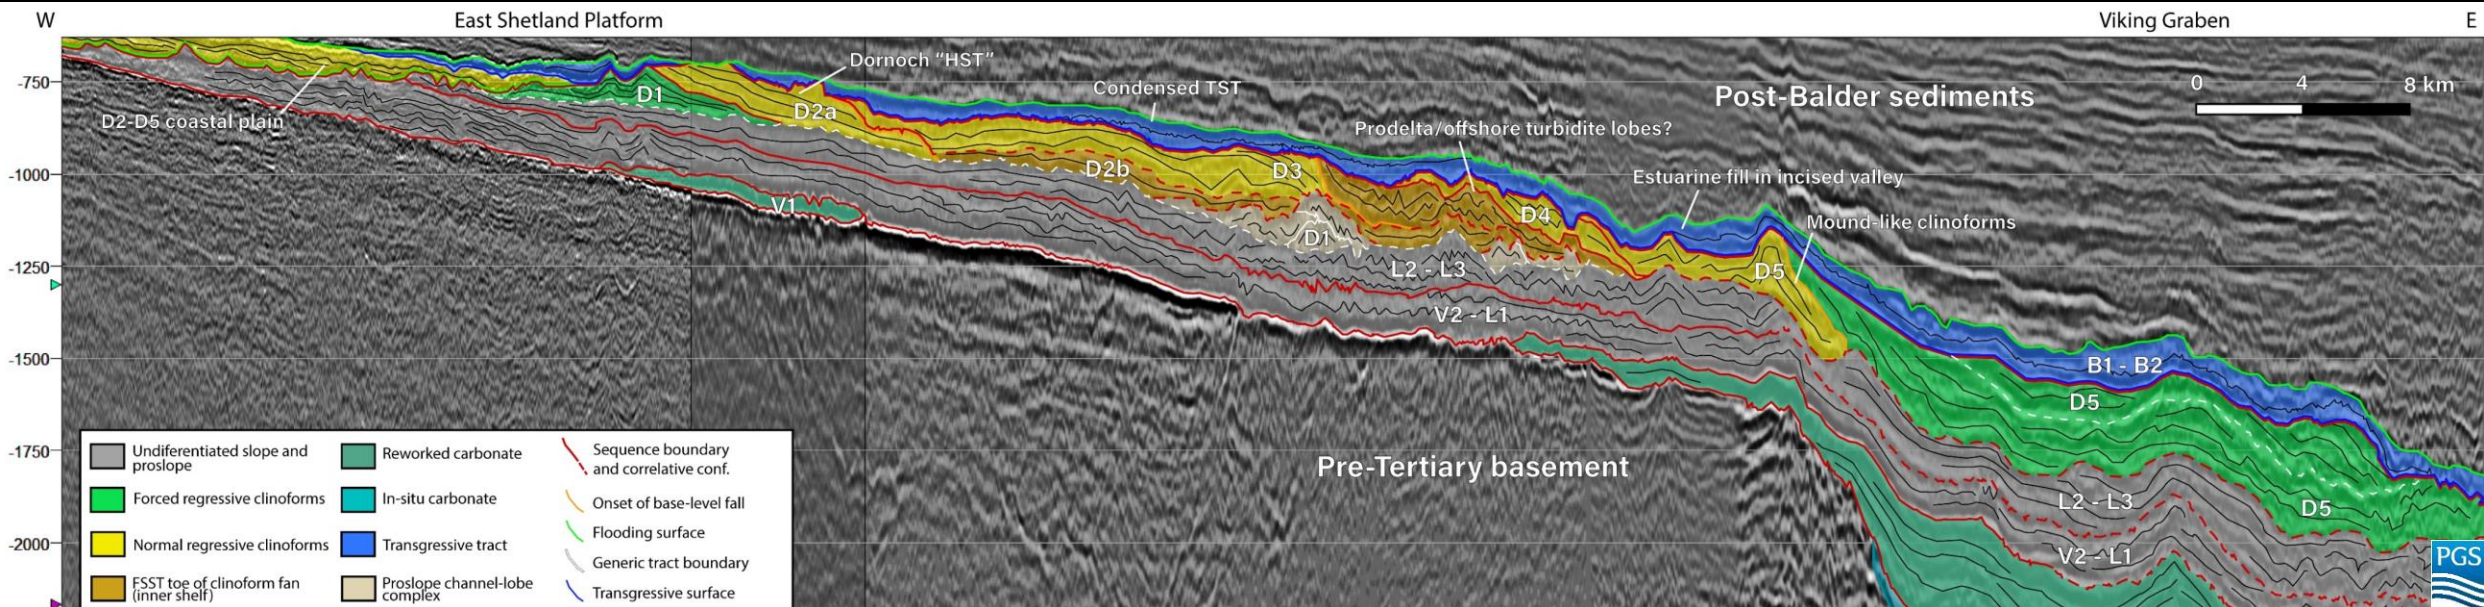

Current results

2D UKOGA ESP + 3D PGS15004 & PGS CNS Megasurvey

- Division based on **seismic stratigraphy** and later correlation to other schemes
- Subdivision of **Moray Group** based on ~4th-order unconformity bounded **depositional sequences** for **Dornoch/Sele Fm**
- Difference in **well log analysis** *versus* **seismic stratigraphy**
- Higher resolution than biostratigraphy?
