

Towards better long-term integration of earth science data from landscape scale to detail studies

W. Brian Whalley

University of Sheffield, UK

b.whalley@sheffield.ac.uk

<https://doi.org/10.5194/egusphere-egu22-4630>, 2022

Take home message:

**Use decimal Latitude Longitude (dLL) to better specify locations, data points and directions,
Specify your metadata for future generations.....**

Earth Science Studies can be ...

Detailed, location-based, then perhaps in inventories

At larger-scales, eg catchment or regional studies

Portrayed by mapping, maps in some form, and (latterly) in GIS

Perhaps linked to other studies: biosciences, engineering etc

Often have associated images, analyses, data points etc

Brought together in papers, reports, theses (or not published!)

Related (perhaps) to previous studies by a 'previous work' section

Characterized by **place name** – **process name** – **time specification**

On maps, perhaps located by (generalized) latitude – longitude: ° ' ''

Suggesting using **decimal Lat Long** as csv: [69.433650,19.865506]

- **ve** indicates southern hemisphere (Lat) or west of prime meridian (Long)

Transect (bearing) specified by csv: {69.433650,19.865506,010}

Archiving and exploring images using dLL

[69.50929,19.97871,@1975]

(Plateaus and glaciers of Lyngen, Norway)

[69.50349,19.99331,@1986]

Bredalsfjellet

[69.50929,19.97871]

Bredalsfjellet,
GE image 15Aug 2015

[69.50929,19.97871,@1987]

Images relate to papers and
maps, glacier inventories etc
of this area, preferably by
their DOIs. Data 100+ years

[69.50929,19.97871,@1975]

'Flutes glacier' [69.4457,19.9159]
(Gordon *et al*, 1992, Quaternary Science)

dLL in Critical Zone Studies

Critical Zone studies can incorporate dLL specified data.

Also in

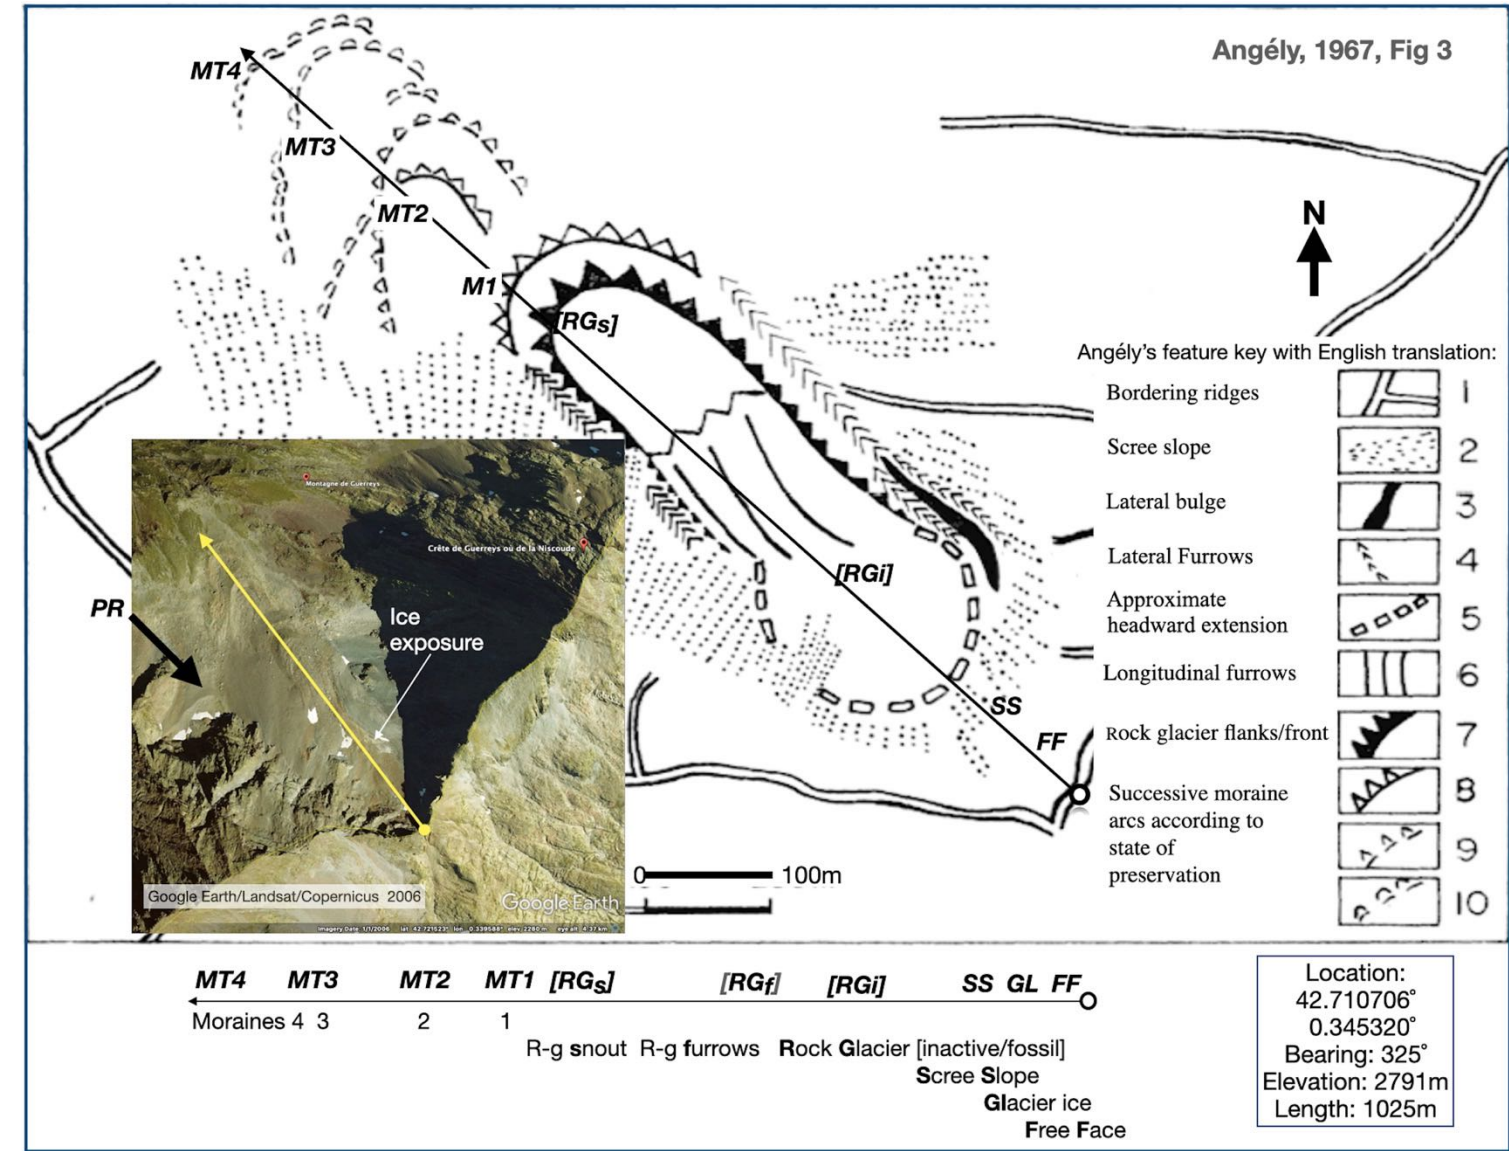

**Environmental management,
Hazard and risk appraisal,
Policy making etc**

Topography on map
and/or DEM and
representing an aerial
or satellite or UAV
image linked to sensor
data.

A dLL specification
becomes part of the
metadata of an image,
data point etc

Adding to and improving on geomorphological (etc) maps

Transects using dLL, summarize data and relate elsewhere

Whalley, W.B. 2021, GFDQ Fig. 4. DOI 10.4461/ GFDQ.2021.44.4

Using dLL specified in transects in landsystem analysis

Whalley, W.B. 2021, Geografiska Annaler, Fig. 4. <https://doi.org/10.1080/04353676.2021.1986304>

How can we bring these diverse studies together and benefit from it as a community?

Studies are traditionally, in titles especially, specified by place – locations shown in maps, use dLL embedded in caption so it becomes machine readable.

Geomorphology doesn't really have a uniform classification system – whether by 'location', 'process' or 'landform'

FAIR: findable, accessible, interoperable, reusable

Whalley, W.B. 2022, ESP&L. <https://DOI: 10.1002/ESP.5418>

Use metadata to apply DLL to images, tabulated and analytical data and (especially) in inventories.

Connectivity & continuity via Eulerian and Lagrangian co-ordinate systems

Landsystems undergo

Erosion – transport – deposition etc

E → T → D →

**where the arrows represent
'geomorphic operators' connecting dLL
locations to investigate connectivity**
