GEOW

Studied substrates (ubiquitous in the environment)

Proposed scheme for the formation of a methyl radical originated from methionine

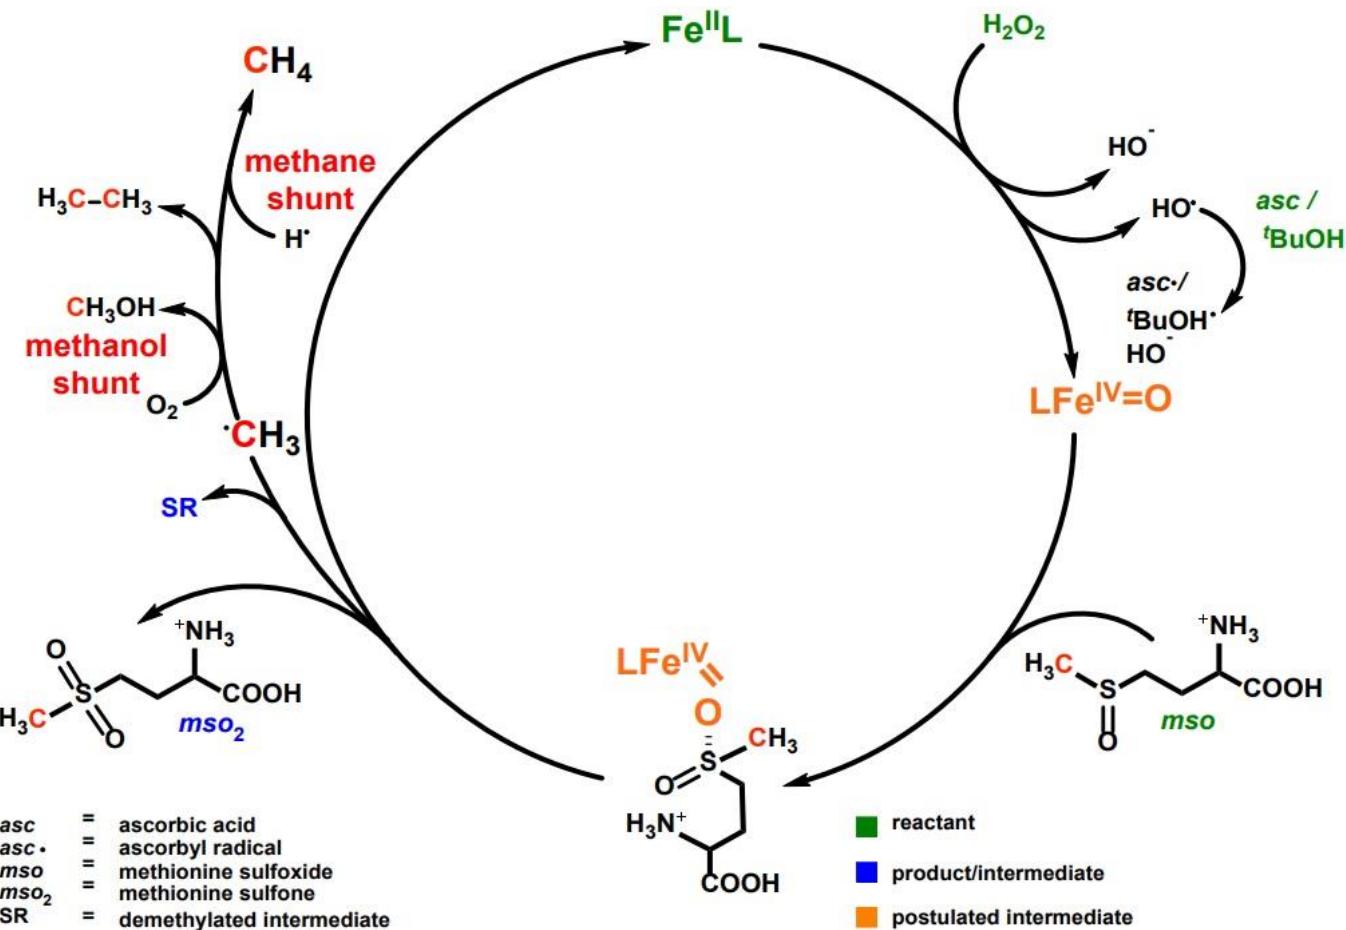

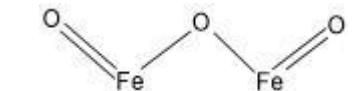

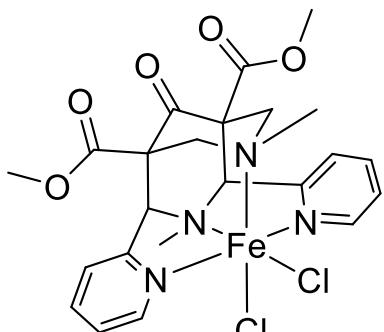

Figure modified after Althoff *et al.* 2014
and Benzing *et al.* 2017

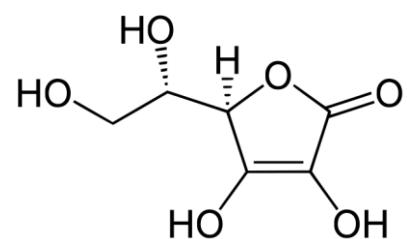

Experimental setup

hematite

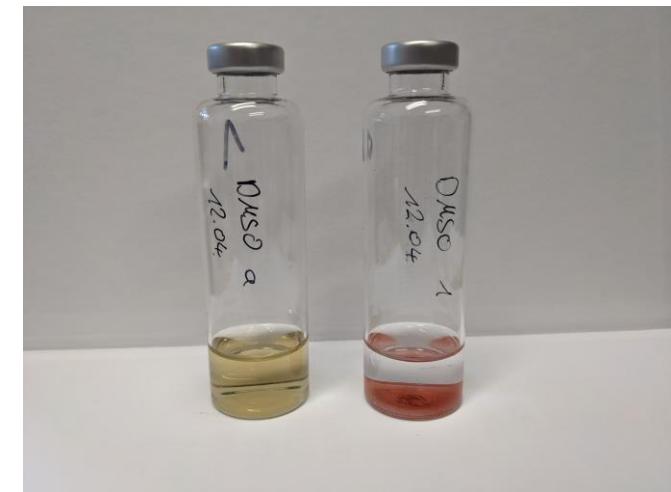

CH₃CN
artificial bispidine
complex
 $[\text{Fe}(\text{N}_2\text{Py}_2)\text{Cl}_2]^*\text{CH}_3\text{CN}$

ascorbic acid

Reactant
Bispidine/Hematite
Ascorbic acid
Hydrogen peroxide (30%)
Substrate

Measurement of ^2H -labeled methane, ethane, methanol and formaldehyde in the experiments with DMSO d6

Chromatograms
and measured
masses:

- CD_3H_1
- C_2D_6
- CD_3OH
- CD_2O

derivatized with
pentafluorophenyl-
hydrazine

Conclusion

- Clear evidence that the C₁-C₂-components originate from the S- N- P- and O-hetero-bonded methyl group
- Different yields of the C₁ and C₂ components depending on the precursor
- Sterile soil also has the ability to produce C₁-C₂ components
 - Mainly methanol and formaldehyde → may originate from Galacturonic acid methyl ester and sinapyl alcohol
