Axial Seamount

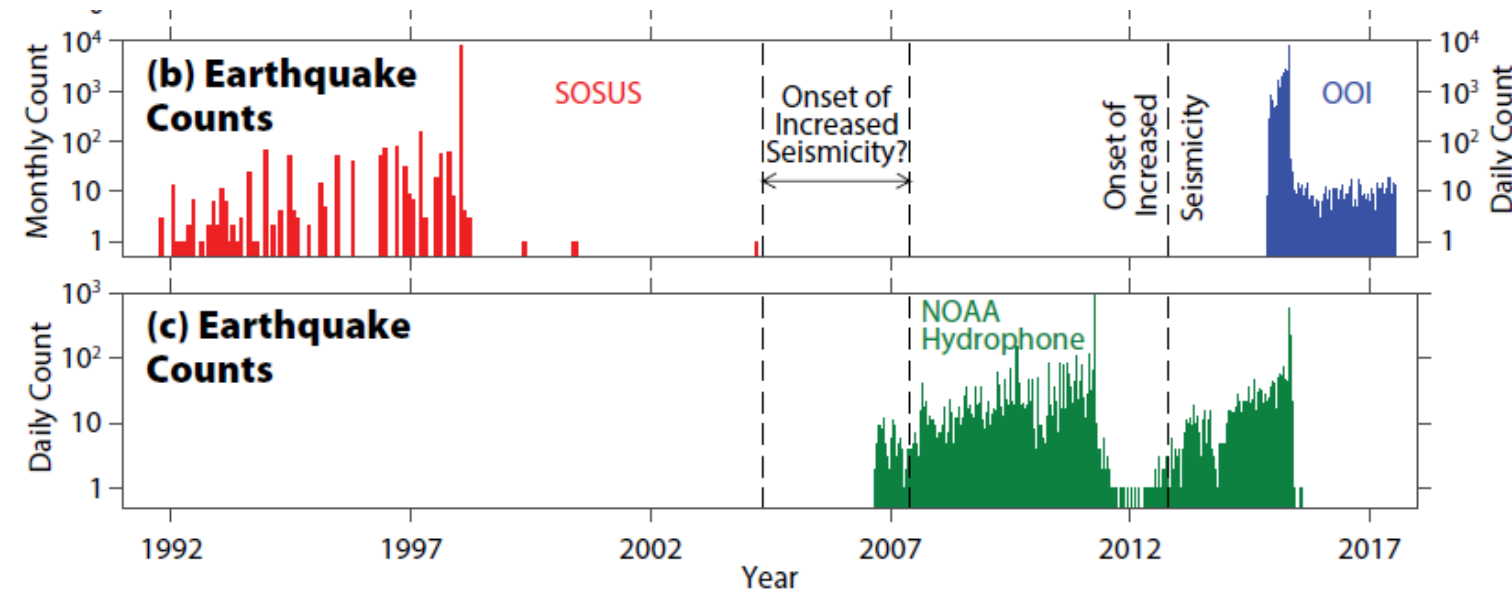

(MBARI)

Long-term inflation/deflation record in Axial caldera

(PMEL)

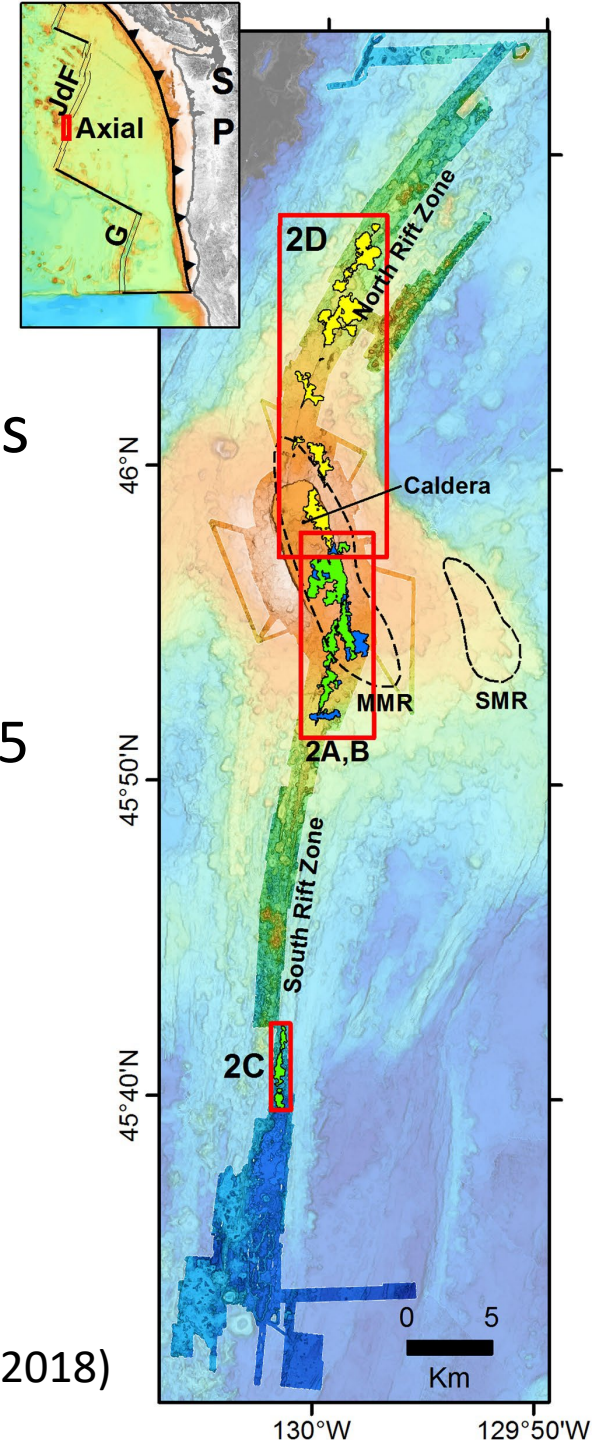

(Wilcock et al., 2018)

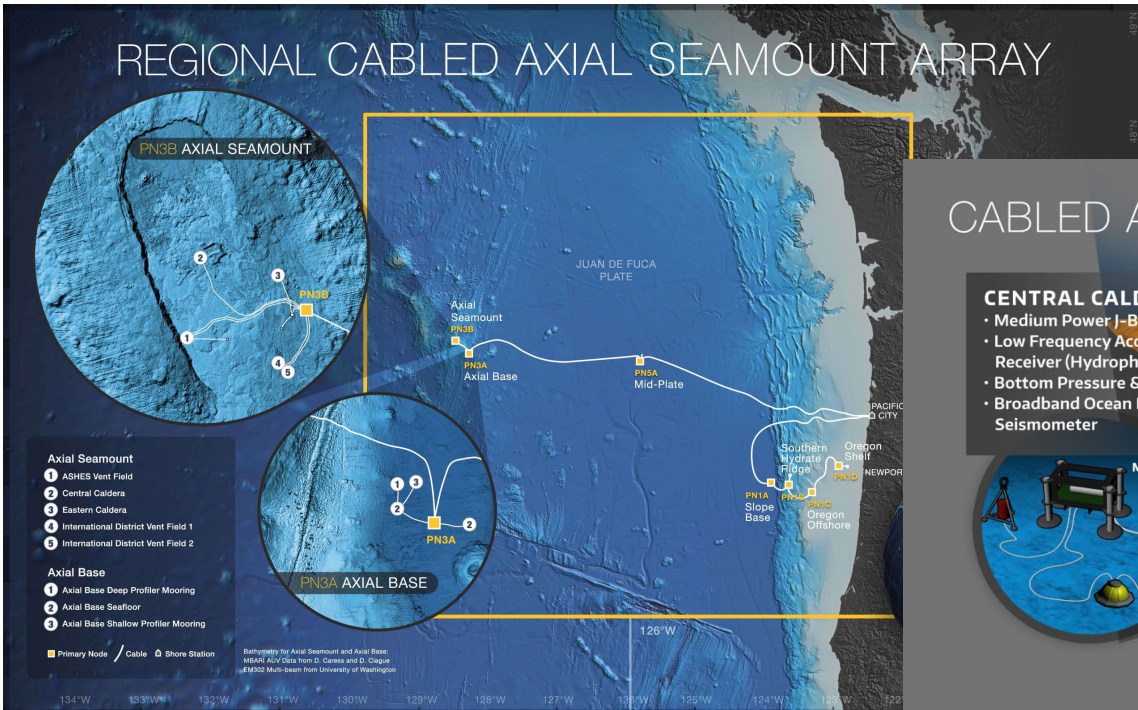

Past Eruptions

- January 25, 1998
- April 6, 2011
- April 24, 2015

(Clague et al., 2018)

Focus Site for OOI: Real-time Monitoring since 2015

CABLED ARRAY: AXIAL CALDERA

CENTRAL CALDERA 1500 M

- Medium Power J-Box (MJ03F)
- Low Frequency Acoustic Receiver (Hydrophone)
- Bottom Pressure & Tilt
- Broadband Ocean Bottom Seismometer

EASTERN CALDERA 1500 M

- Medium Power J-Box (MJ03E)
- Low Frequency Acoustic Receiver (Hydrophone)
- Bottom Pressure & Tilt
- Short-Period Ocean Bottom Seismometers
- Broadband Ocean Bottom Seismometer

ASHES VENT FIELD 1500 M

- Medium Power J-Box (MJ03B)
- Osmosis-Based Water Sampler
- Diffuse Vent Fluid 3-D Temperature Array
- HD Digital Video Camera
- Short-Period Ocean Bottom Seismometers

INTERNATIONAL DISTRICT 1 1500 M

- Medium Power J-Box (MJ03C)
- Particulate DNA Sampler
- Mass Spectrometer
- Digital Still Camera
- Hydrothermal Vent Fluid Interactive Sampler
- Hydrothermal Vent Fluid In-situ Chemistry
- Hydrothermal Vent Fluid Temperature and Resistivity

INTERNATIONAL DISTRICT 2 1500 M

- Medium Power J-Box (MJ03D)
- 3D Single Point Velocity Meter
- Bottom Pressure & Tilt
- Short-Period Ocean Bottom Seismometer

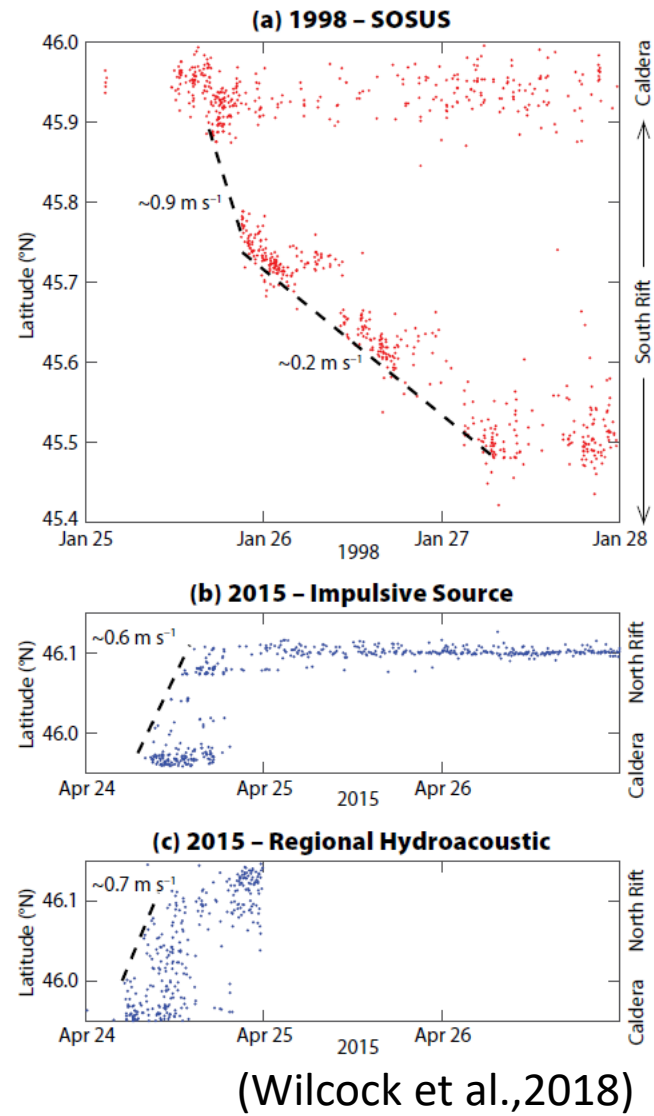

Main Magma Reservoir

Believed to be source of eruption
lava with lateral dike intrusion
into the rift zones

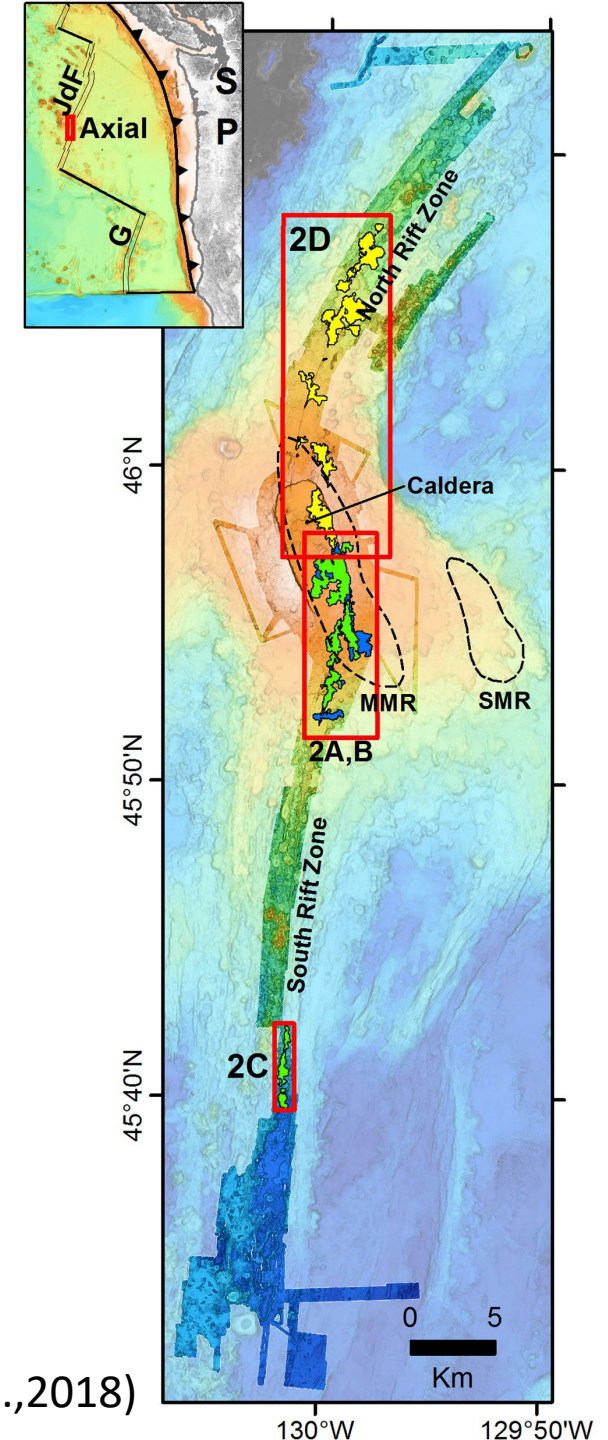

- Eruptions believed to initiate beneath the caldera with dike propagating into the rift zones
- The main magma reservoir where the eruption and intrusion event initiate has been well imaged but little is known of the internal magmatic structure beyond the caldera
- Prior studies infer that all erupted magma originates from beneath the caldera

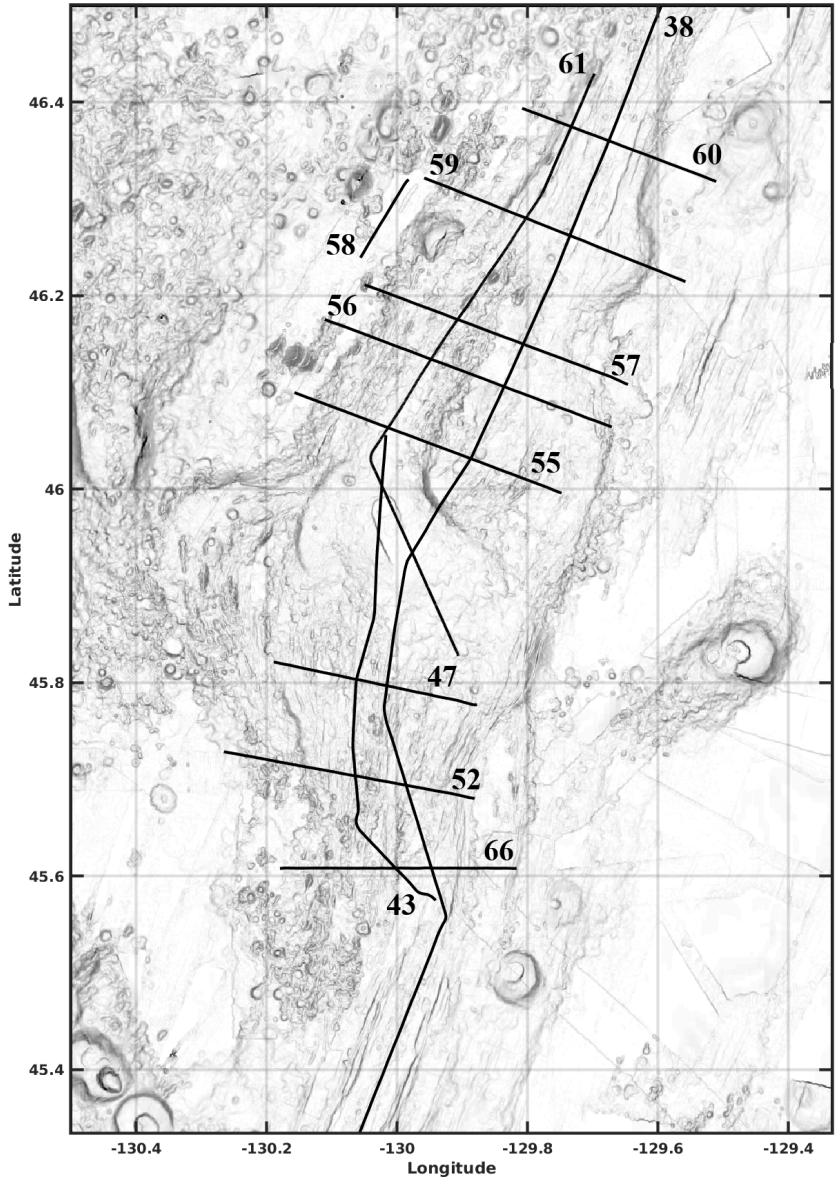

□ Are there magma bodies beneath the rift zones that could be additional magma sources for the eruptions?

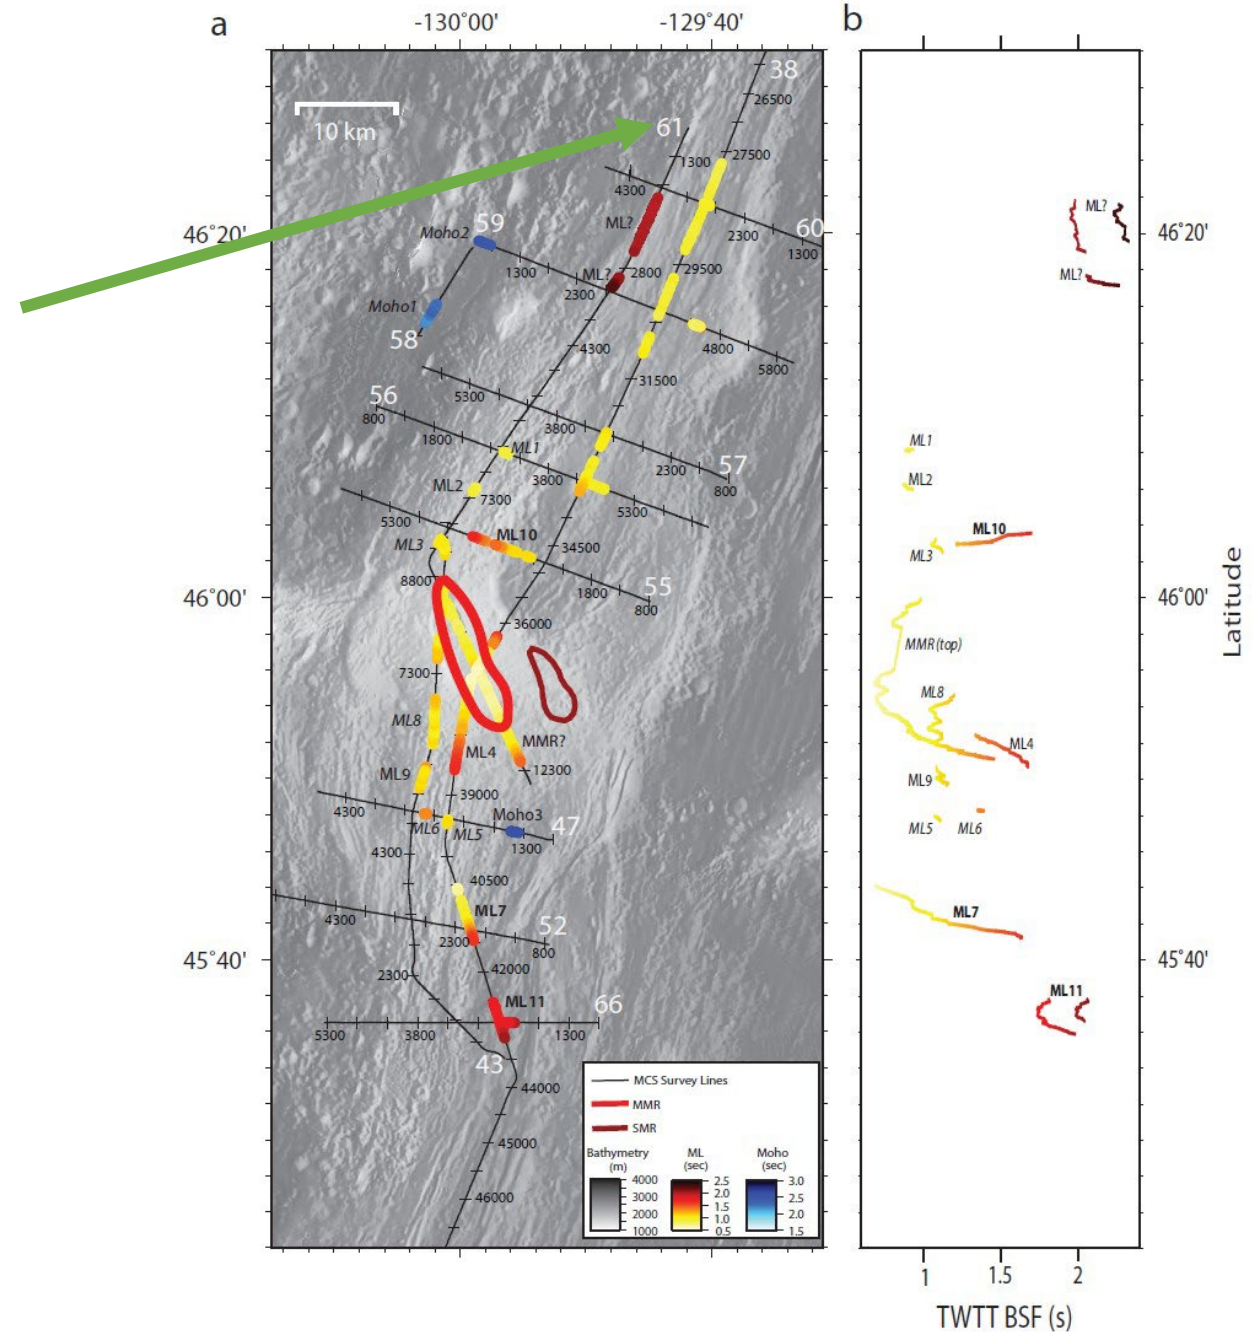

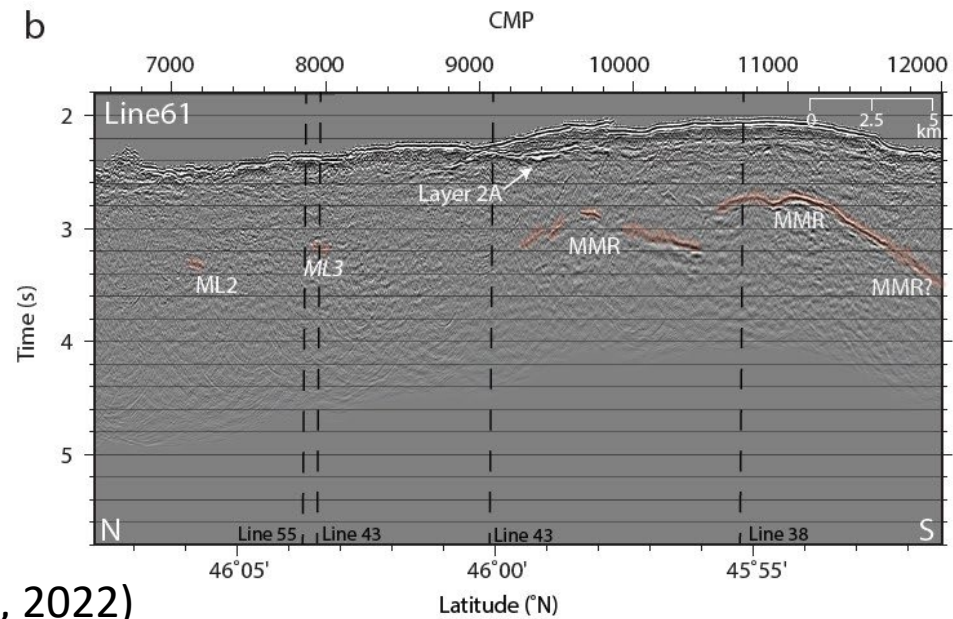

(Clague et al., 2018)

Data

Results

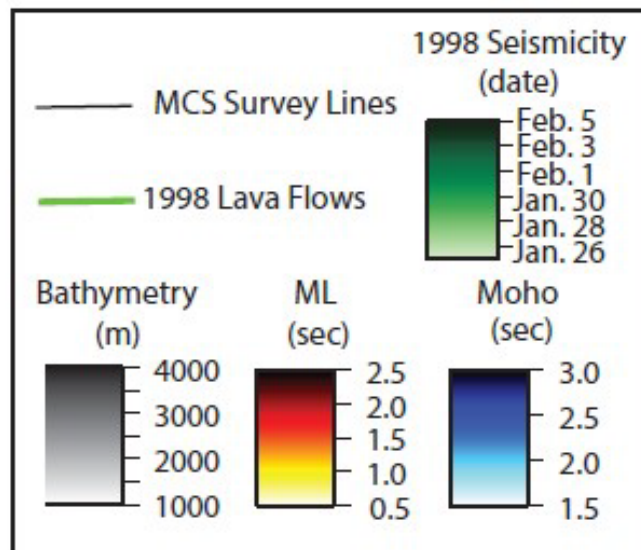

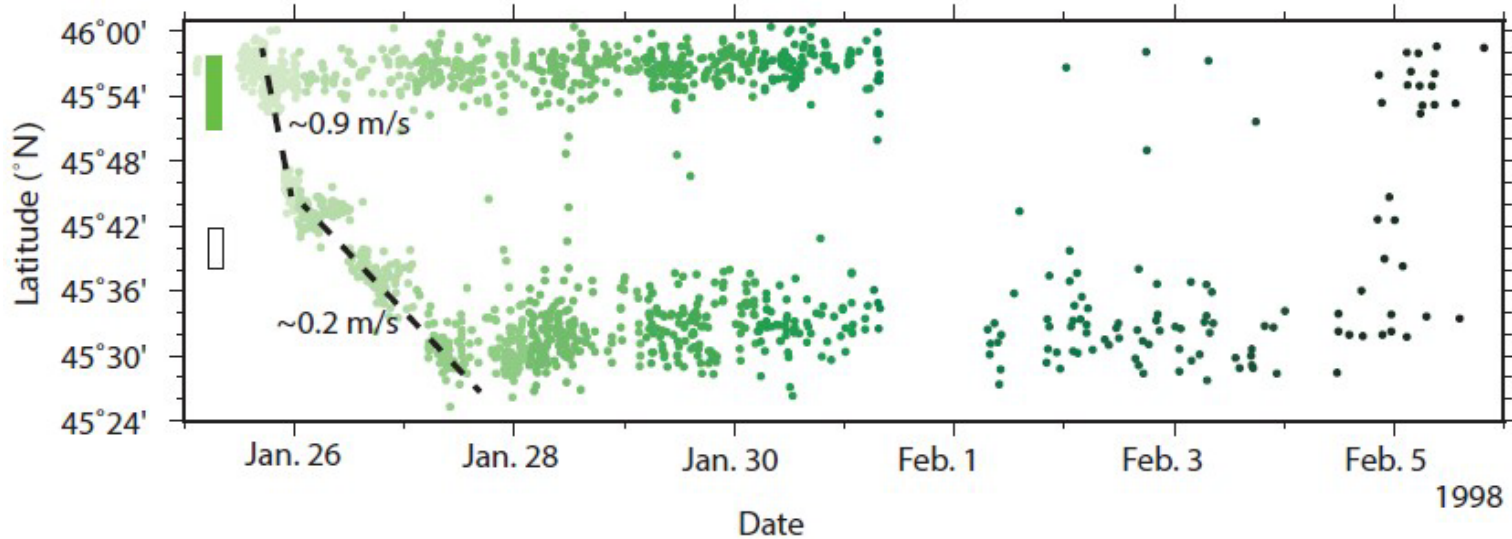

(Lee et al., 2022)

Discussion 1: Magma distribution beneath the SRZ and NRZ and relation to 1998/2011/2015 eruptions

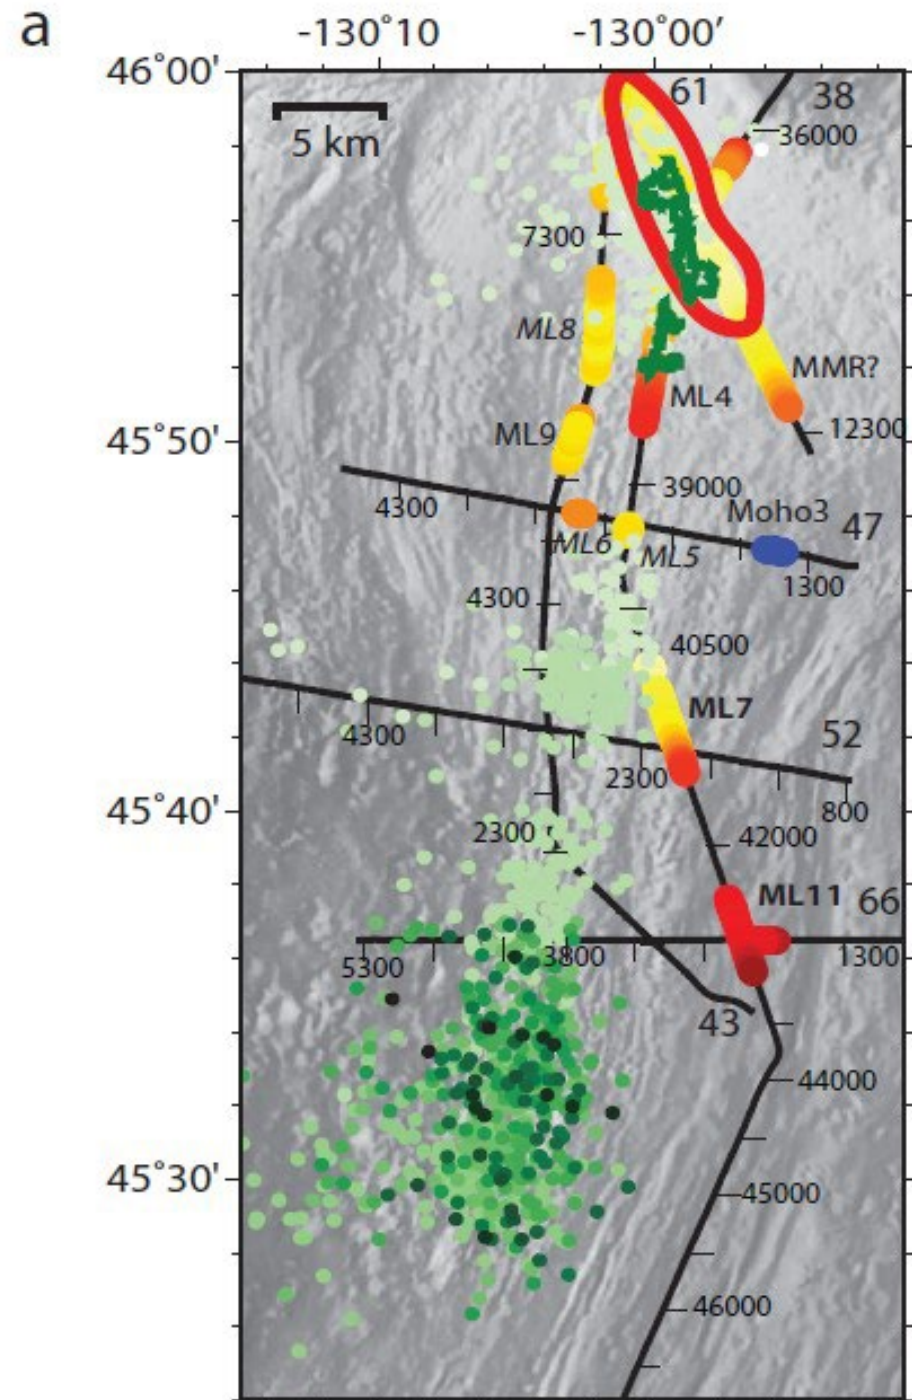

(Lee et al., 2022)

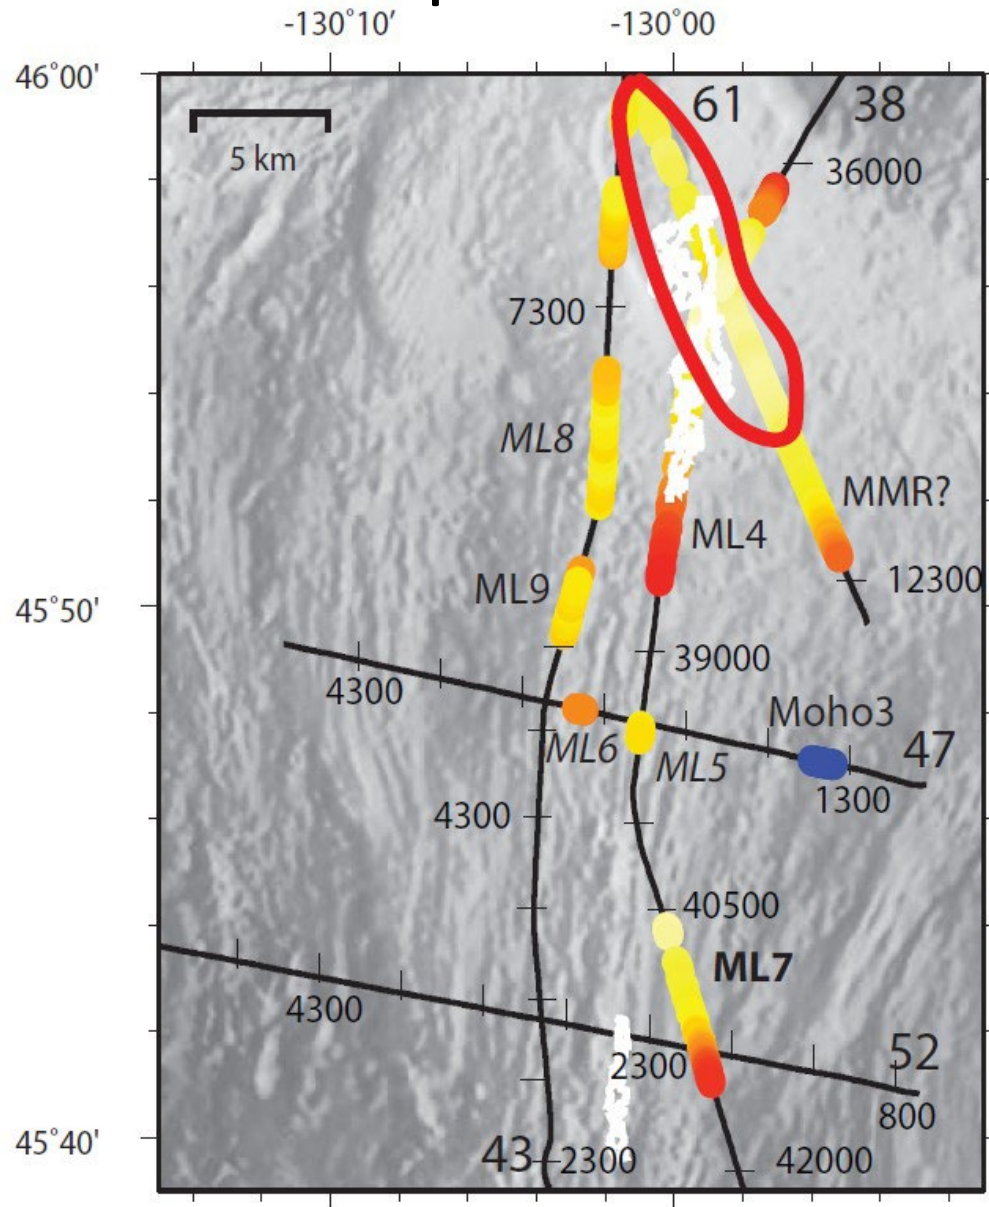

1998 Eruption

(Lee et al., 2022)

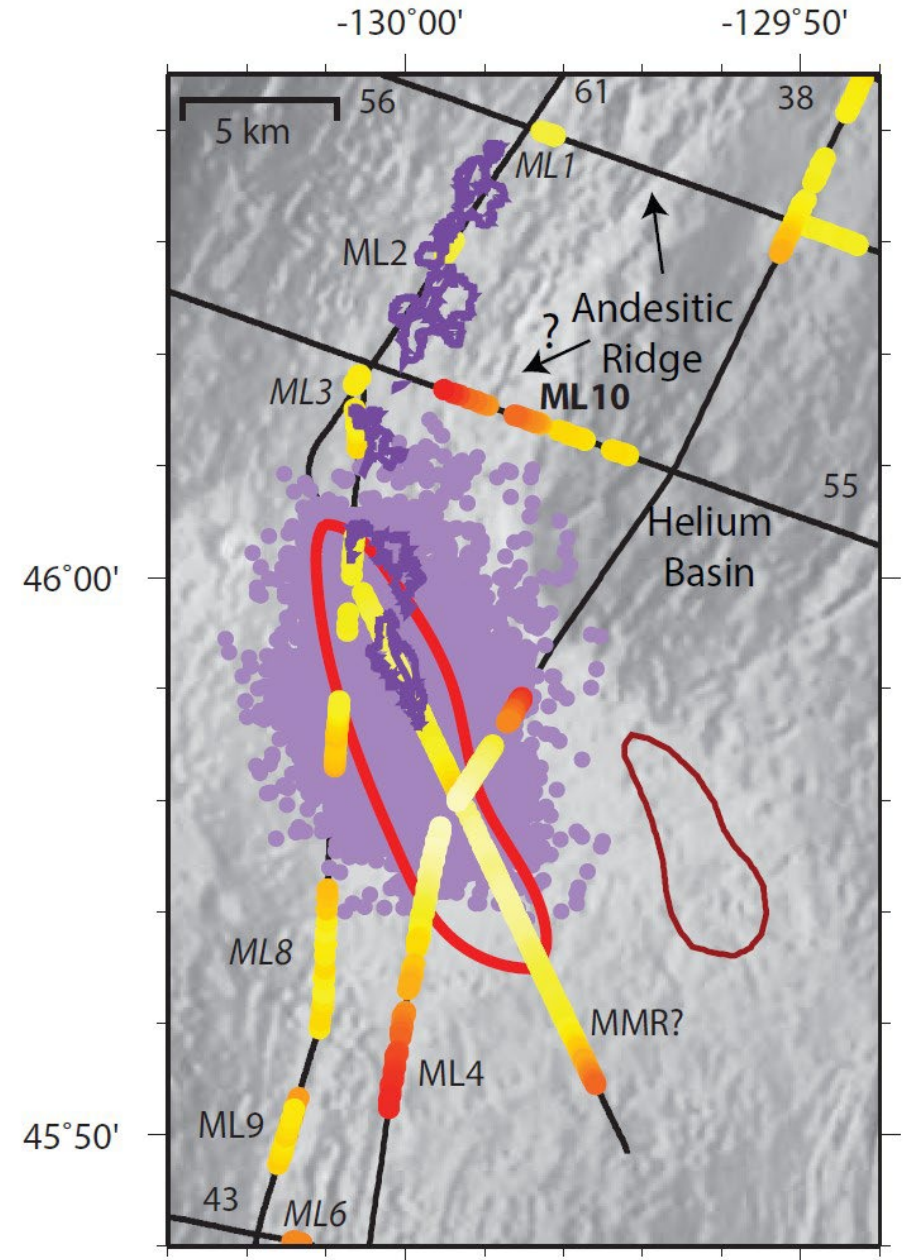

2011 Eruption

(Lee et al., 2022)

2015 Eruption

Discussion 2: Magma
distribution and insights
into chemical variation of
erupted lavas

Spatial variations in lava composition

MgO (wt%)

- 6.49 - 6.80
- 6.81 - 7.10
- 7.11 - 7.25
- 7.26 - 7.40
- 7.41 - 7.55
- 7.56 - 7.70
- 7.71 - 7.85
- 7.86 - 8.00
- 8.01 - 8.15
- 8.16 - 8.31

Lava flows

- ▭ 2011
- ▭ 1998

Fissures

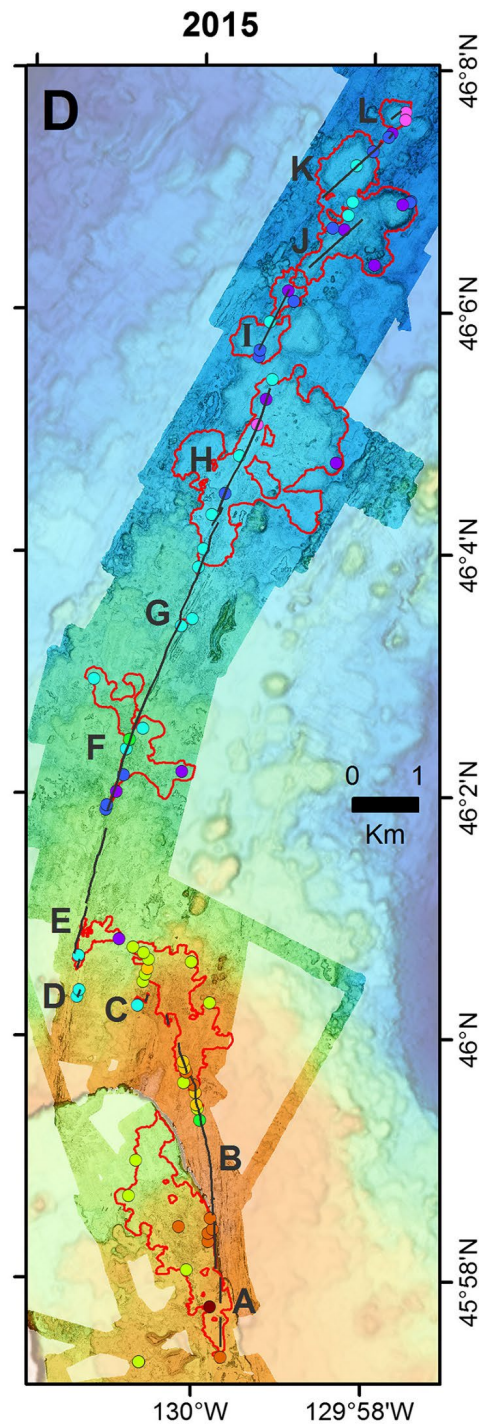

0 0.5

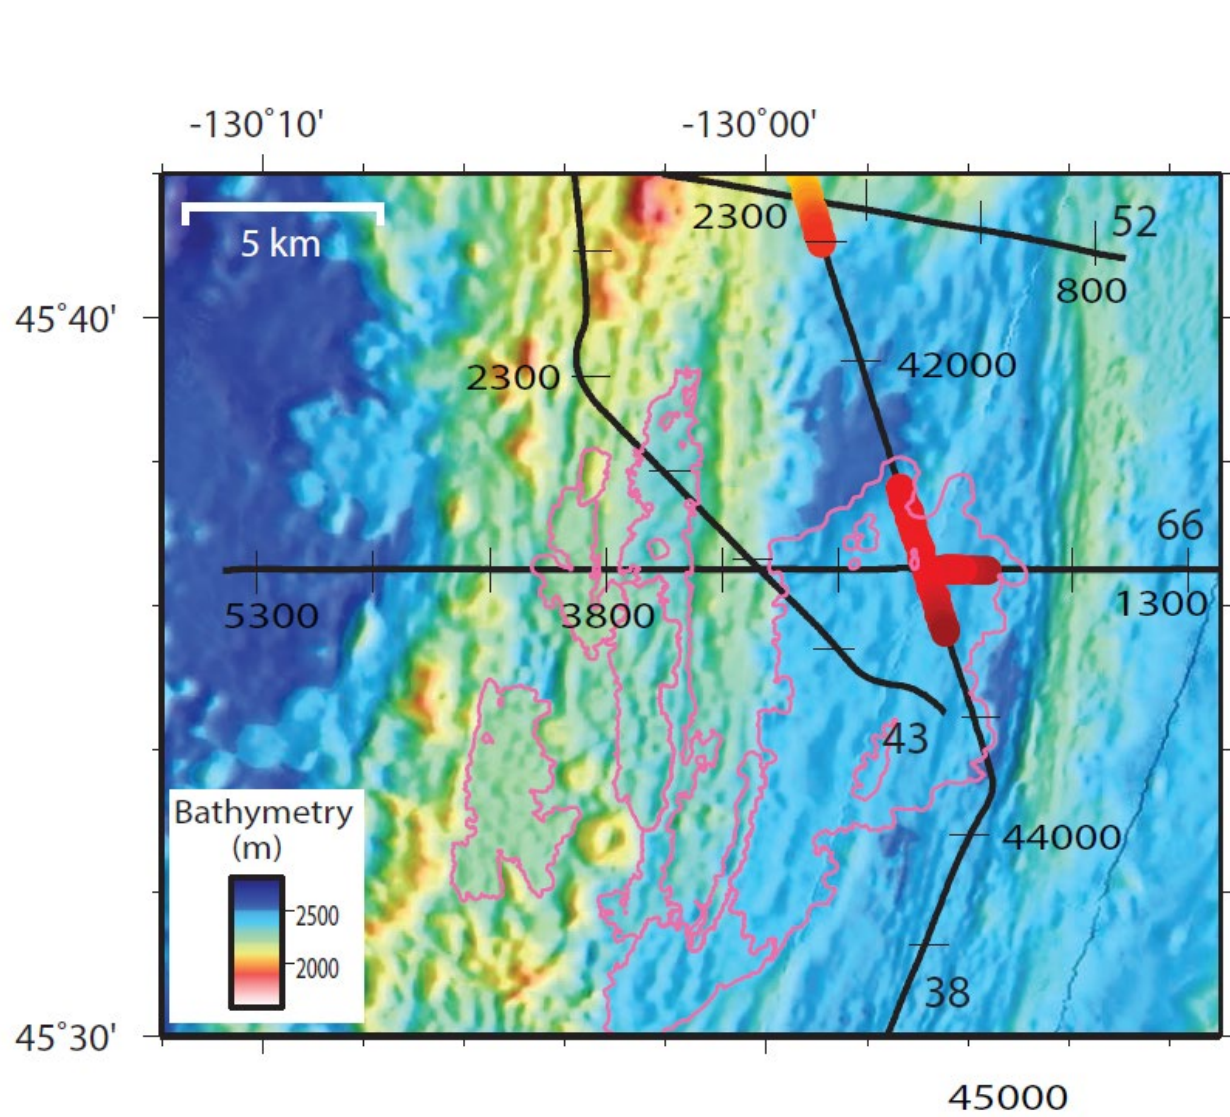

(Clague et al., 2018)

(Distal 2011 Lava Flow)

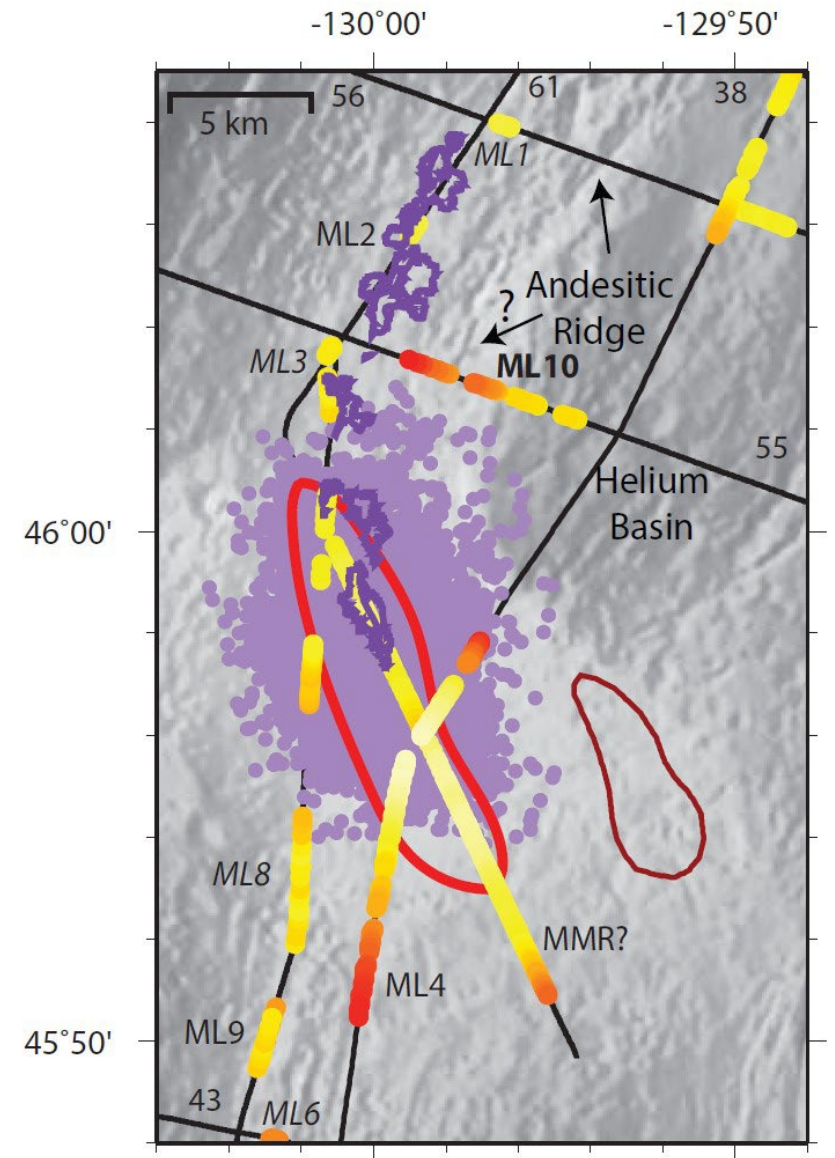

Discussion 3: Magma
bodies beneath the rift zone
overlap regions with
adjoining JDF segments

SRZ and Vance Segment

(Lee et al., 2022)

NRZ and Coaxial
(Helium Basin)

Conclusion

- Small discontinuous magma bodies are imaged beneath the rift zones
 - These bodies could be additional sources of magma during the 1998, 2011, and 2015 eruption and intrusion events
 - These bodies may account for the more evolved composition of the rift zone eruption lavas relative to those within the caldera
 - Supporting model for mixing of caldera magma with other magma sources as the explanation for MgO pattern instead of conductive cooling and crystallization of magma during dike transport which was favored by Clague et al. (2018)
- Larger magma bodies detected beneath the overlapping regions located between Axial and neighboring segments of the JdF ridge
 - Local magma reservoirs for volcanism within these discontinuity zones
 - Potential magma transport between adjoining segments
