Fun with ambiguities

Understand cranky uncles by becoming a cranky uncle

The game helps players to understand cranky uncles by becoming cranky uncles themselves.

To begin with, players learn the techniques of science denial: fake experts, logical fallacies, impossible expectations, cherry picking and conspiracy theories.

These can be easily remembered via the abbreviation FLICC.

Cranky Uncle mentors you on how to deny science

Cranky Uncle mentors players on how to deny science. He does this by explaining how he goes about doing just that and by posing some trial questions.

> the denial techniques they can practice their denial spotting with the help of cartoon quizzes and

How can models predict

climate 100 years out when they can't get the forecast right next week?

Build up cranky points

Whenever players answer quizzes correctly, they earn and build up their cranky points, making it rewarding to stick with the game.

Whenever a threshold of cranky points is passed, players go up one cranky level and their mood gets ever crankier.

Unlock new denial techniques

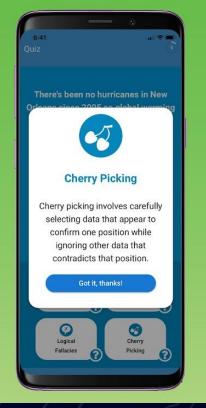

Once a player has learned the initial five techniques, further denial techniques become available "below" logical fallacies (7), cherry picking (2) and conspiracy theories (7).

Definitions for the fallacies are readily available as pop-ups in the multi-fallacy quizzes.

Part 3.
Fighting misinformation
with critical thinking

The video series titled "The Science of Cranky Uncle" explains, why we can't ignore misinformation, examines research into the different ways misinformation does damage, looks at research into how inoculation theory offers an approach for building public resilience against misinformation. It also explains how critical thinking can be used to deconstruct misinformation and identify misleading reasoning fallacies and rhetorical techniques.

Teachers can sign up for a group code making it quick and easy for students to anonymously enter the game (avoiding the need to enter an email to play the game). So far, teachers have signed up from 40+U.S. states and 16 other countries.

Cranky Uncle - a critical thinking game to build resilience against climate misinformation in multiple languages Translations of the game (1)

In February 2022 the multilingual version of the <u>Cranky Uncle game</u> was launched. The first two languages available were Dutch and German, followed by Spanish and Portuguese in August and French, Italian and Swedish in December. More languages will be launched soon!

Cranky Uncle - a critical thinking game to build resilience against climate misinformation in multiple languages Translation fun with ambiguities - simple

The really hard to resolve issues for the translation teams were those related to the 'Ambiguity' fallacy where one word has different meanings for scientists and lay people which then gets exploited by science deniers. Not all are as easy as the word "theory" which translates 1:1 into other languages and also has the same meaning scientifically on the one hand and in everyday language on the other.

Cranky Uncle - a critical thinking game to build resilience against climate misinformation in multiple languages Translation fun with ambiguities – tricky (1)

Here is an example from the English version of the game where the quiz displays a dog:

"Trees have bark and I bark. So I must be a tree!"

Run this through a translator and you get this for German:

"Bäume haben eine **Rinde** und ich **belle**. Also muss ich ein Baum sein!"

...and this for Dutch:

"Bomen hebben **schors** en ik **blaf**, dus ik moet een boom zijn"

Cranky Uncle - a critical thinking game to build resilience against climate misinformation in multiple languages Translation fun with ambiguities – tricky (2)

The direct translation loses the ambiguity present in the English text with the word "bark" because "Rinde" and "belle" are two obviously completely different words in German as are "schors" and "blaf" in Dutch. We eventually came up with this:

German

"Knecht Ruprecht hat eine Rute und ich habe eine Rute. Also muss ich Knecht Ruprecht sein!" (This translates back to "Knecht Ruprecht [he's accompanying Santa Claus in Germany] has a rod and I have a tail. So I must be Knecht Ruprecht!")

Dutch

"Een graaf is van adel, ik graaf. Dus ik moet van adel zijn!"
(This translates back to "A "count/earl" is of nobility, I "dig". So

I must be of nobility!")

During 2022, the Cranky Uncle team has been working with UNICEF, the Sabin Vaccine Institute, the University of Nairobi, and Makerere University to develop a vaccine edition of the Cranky Uncle game for East Africa. This involved a series of co-design workshops in Uganda, Kenya, and Rwanda. Participants played the game, which targets common fallacies in vaccine misinformation, and offered feedback on how to make the game's content and cartoon characters more culturally relevant in their country.

Cranky Uncle - a critical thinking game to build resilience against climate misinformation in multiple languages FLICC - the five main techniques of science denial

Fake Experts

Presenting an unqualified person or institution as a source of credible information.

Logical Fallacies

Arguments where the conclusion doesn't logically follow from the premises. Also known as a non sequitur.

Impossible Expectations

Demanding unrealistic standards of certainty before acting on the science.

Cherry Picking

Carefully selecting data that appear to confirm one position while ignoring other data that contradicts that position.

Conspiracy Theories

Proposing that a secret plan exists to implement a nefarious scheme such as hiding a truth.

Cranky Uncle - a critical thinking game to build resilience against climate misinformation in multiple languages History of FLICC – the techniques of science denial

When John Cook led a 2015 collaboration between the University of Queensland and Skeptical Science to develop the free online course Denial101x: Making Sense of Climate Science Denial, he made FLICC the underlying framework of the entire course. An important component of their debunking of the most common myths about climate change was identifying the denial techniques in each myth. Which is exactly what the Cranky Uncle game now teaches!

Misinformation about climate change does damage in multiple ways. It causes people to believe wrong things, polarizes the public, and reduces trust in scientists. Climate misinformation reduces support for climate action, delaying policies to mitigate climate change. One of the most insidious aspects of misinformation is that it can cancel out accurate information. When people are presented with fact and myth but don't know how to resolve the conflict between the two, they may disengage and believe neither. Consequently, an effective way to counter misinformation is to help people resolve the conflict between facts and myths. This can be achieved through inoculation theory, a branch of psychological research that applies the concept of vaccination to knowledge. Just as exposing people to a weakened form of a virus develops resistance to the real virus, exposing people to a weakened form of misinformation builds immunity to real-world misinformation. In other words, rather than getting lost in details, you explain the misleading rhetorical techniques and logical fallacies used in misinformation. Inoculation has been found to be effective in neutralizing misinformation casting doubt on the scientific consensus on human-caused global warming. However, there are many misinformation techniques and inoculating people against them all is a communication and education challenge. Games offer engaging tools for incentivizing people to repeatedly perform misinformation-spotting tasks in order to build up their critical thinking skills. Games that are fun to engage with while serving a useful educational purpose are known as serious games, and are already being explored as a tool for building resilience against misinformation, using an approach known as active inoculation. Typically, inoculation interventions are passive, with messages received in a one-way direction from communicator to audience. In contrast, active inoculation involves participants in an interactive inoculation process – having them learn the techniques of science denial by ironically learning to use the misleading techniques themselves. The Cranky Uncle game adopts an active inoculation approach, where a "cranky uncle" cartoon character mentors players to learn the techniques of science denial. Cranky Uncle is a free game available on iPhone and Android smartphones as well as web browsers and can already be played in eight languages. The player's aim is to become a "cranky uncle" who skillfully applies a variety of logically flawed argumentation techniques to reject the conclusions of scientific communities. By adopting the mindset of a cranky uncle, the player develops a deeper understanding of science denial techniques, thus acquiring the knowledge to resist misleading persuasion attempts in the future. The game is available in several languages and creating the translations involved some creative problem solving to come up with suitable alternatives where the English content couldn't simply be translated directly. For example, some terms were ambiguous in one language but the ambiguity was "lost in translation", actual people mentioned in quiz questions were not known outside of the US, or a fallacy was named differently in another language, requiring a new icon.
