The Martian Surface Radiation Environment. Zenith Angle Dependence of Fluxes of Different Secondary Particle Species Produced in the Mars Atmosphere

#### Salman Khaksarighiri

Robert Wimmer-Schweingruber, Timothy J Stubbs, Mark D. Looper, Phillip H. Phipps, Jingnan Guo, Donald M. Hassler, Bent Ehresmann, Cary Zeitlin, Daniel Matthiä, Thomas Berger, Günther Reitz, Sven Löffler, Jan Leo Löwe

EGU 2024

#### Characterizing Radiation Environment on the Martian Surface

Atmosphere Nars

Primary Particles Galactic Cosmic Rays Solar Energetic Particles

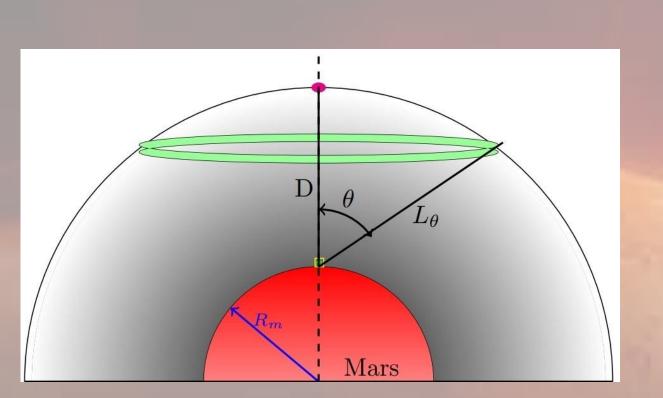

Secondary Particle Productions (Atmosphere)

> Secondary Albedo Particles (Regolith)

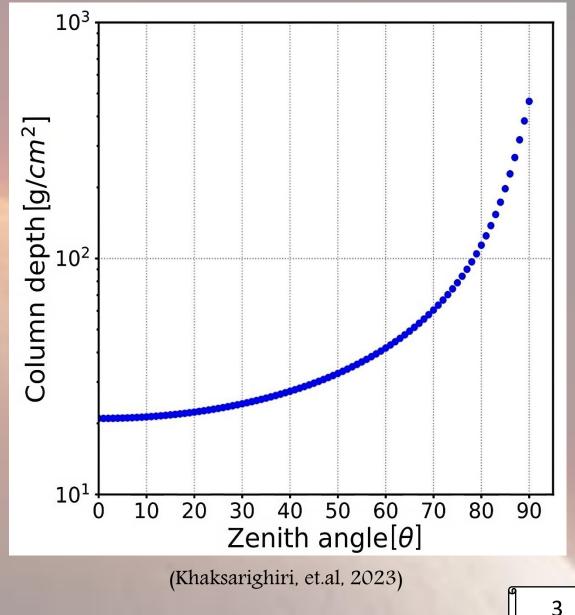

NOT TO SCALE

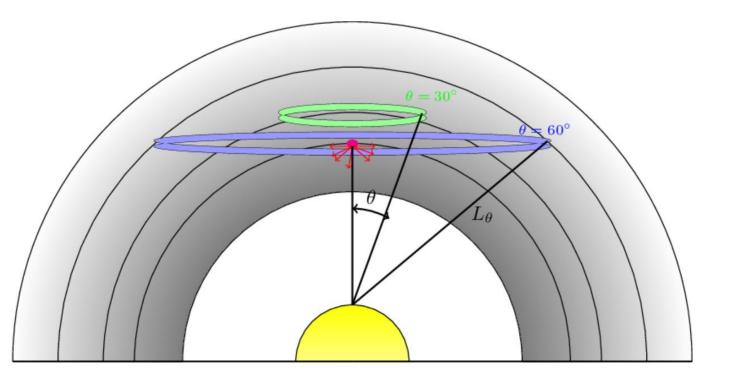

# Atmospheric Column Depth in Different Zenith Angles

D: Distance between the RAD and magenta point  $L_{\theta}$ : Effective scale height depends on the zenith angle  $\theta$   $R_m$ : Mars radius

## Mars surface modeled in Geant4

#### Particle Sources

Energy range : 1–100 GeV for proton and He Energy distribution : 62 log bins with power-law index of  $\alpha = -1$ Particle Number : 10<sup>6</sup> per bin, total of 6.2× 10<sup>7</sup> particles Our Model has been validated with the RAD measurement on the Martian surface in a previous research (Khaksarighiri, et.al, 2023)

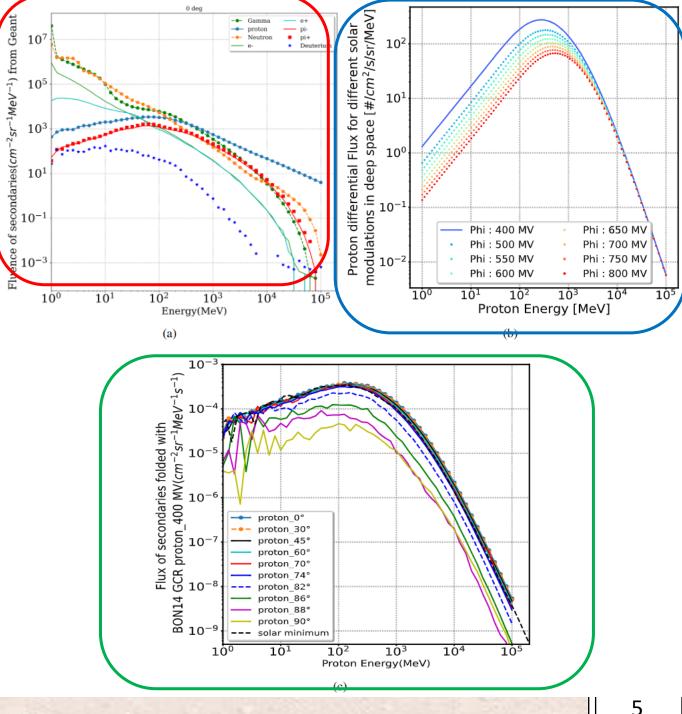

# Implications for Deep Space Radiation

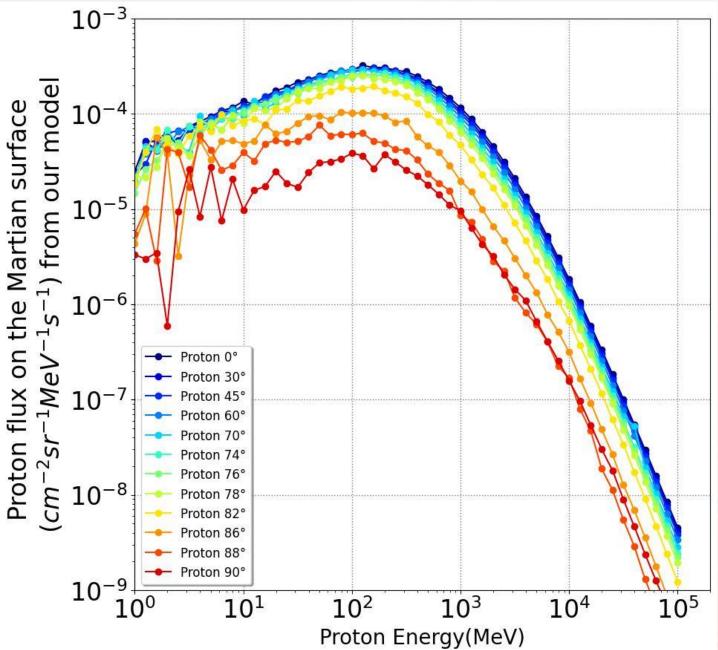

• The folding is done using:

•  $\dot{F} = \left\{\frac{F_m}{f}\right\} \times F$ 

- $F_m$ : Fluence of produced species on the surface of Mars (#  $cm^{-2} sr^{-1} MeV^{-1}$ )
- f. Fluence of the primary source (#  $cm^{-2} sr^{-1} MeV^{-1}$ )
- F: differential flux of GCRs
- $\dot{F}$ : flux of secondaries per energy bin that reach the surface of Mars in each zenith angle

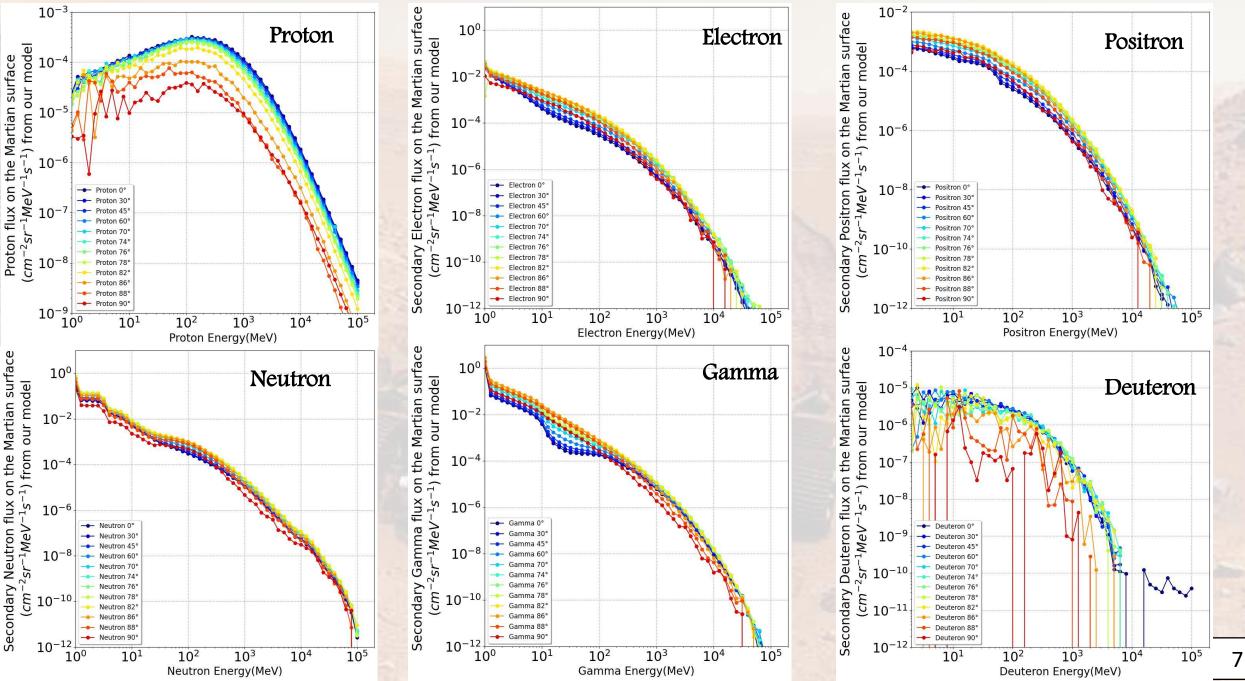

### Flux of secondaries on the Martian surface

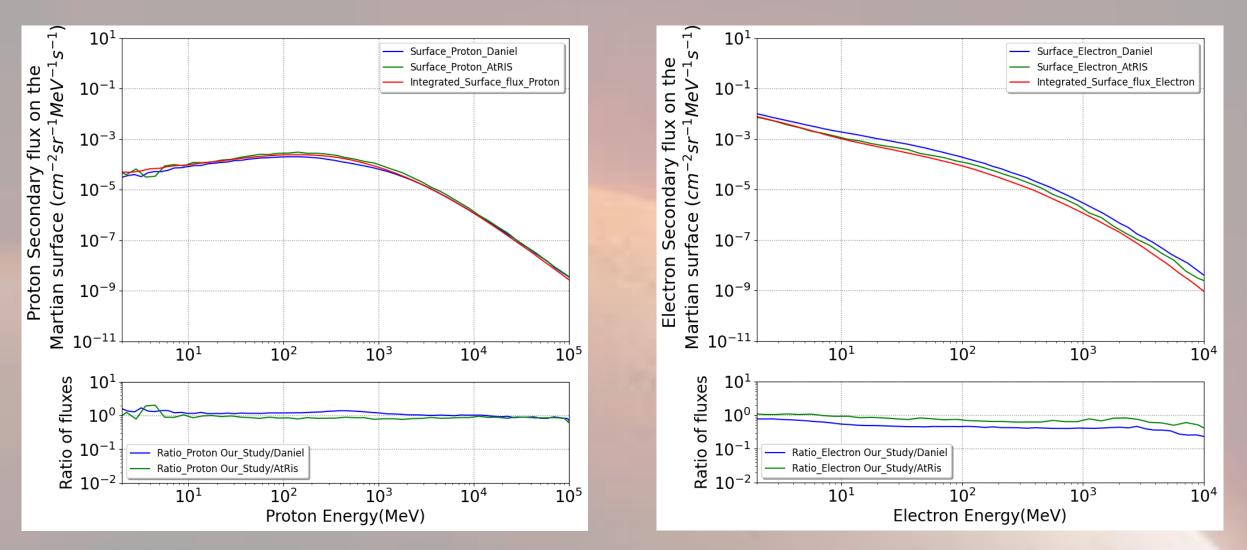

6

#### Flux of secondaries on the Martian surface

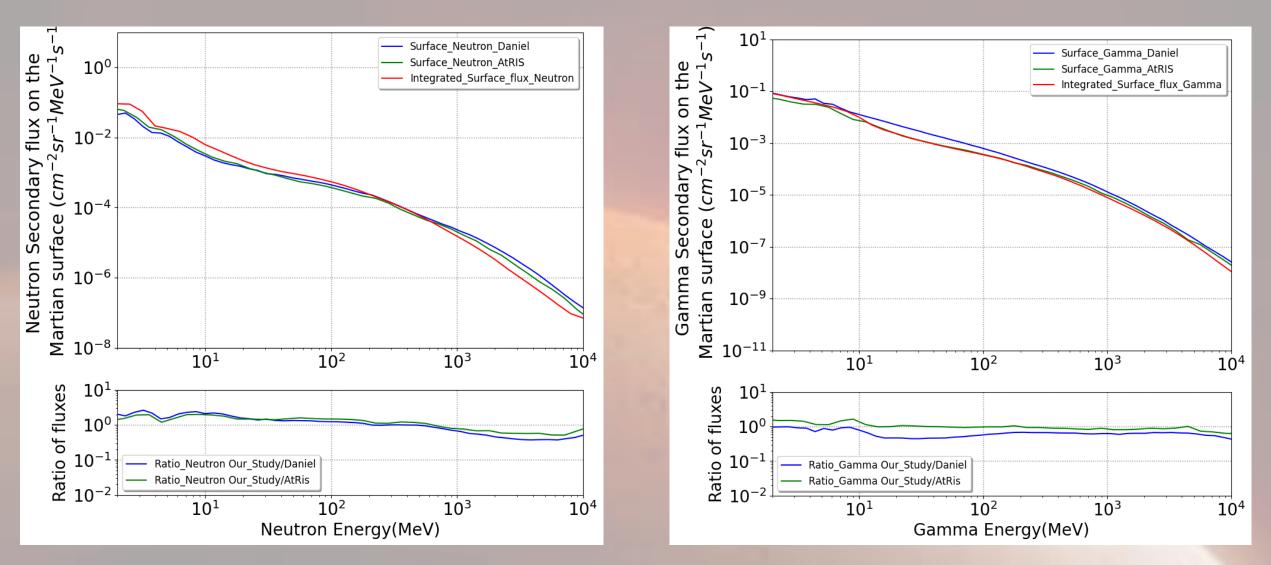

#### Comparing Results with Previous Studies

(Daniel et.al 2017, Banjac et al. 2019 (AtRIS))

#### Comparing Results with Previous Studies

(Daniel et.al 2017, Banjac et al. 2019 (AtRIS))

# Summary & Conclusions

✓ Radiation dose is non-isotropic on the Martian surface

✓ Martian surface radiation influence by topographical features

✓ HZE contribution are higher at smaller zenith angles : Clever helmet design

Select suitable

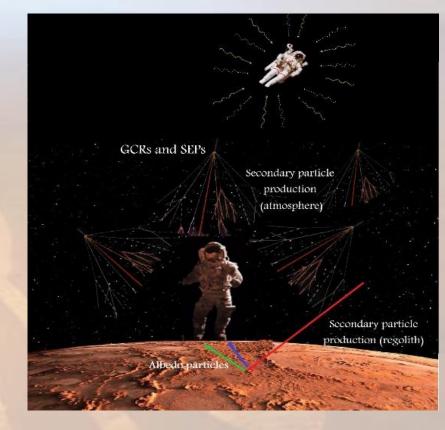

landing sites

(Khaksarighiri 2023. et.al)

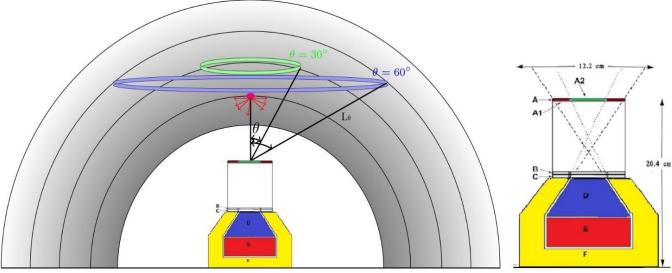

✓ The secondary albedo dose is about 19% of total Marian surface dose

(Jingnan Guo, Khaksarighiri 2021. et.al.)
