#### NEOGENE BIOSTRATIGRAPHY IN THE NIGER DELTA BY INTEGRATING FORMINIFERA AND PALEOCEONOGRAPHIC CONDITONS

\*Joshua Avong Solomon, \*Enam Obiosio, \*Hamidu Ibrahim, #Ubit Gospower, and Linus Anyanna \*Department of Geology, Ahmadu Bello University Zaria, #Department of Applied Geology, Abubakar Tafawa Balewa University, Department of Geology, Federal University Gusau, Nigeria.

#### PRESENTED BY SOLOMON JOSHUA AVONG

#### AT THE EUROPEAN GEOSCIENCES UNION GENERAL ASSEMBLY,2024

### **Presentation Outline**

- Background of the study
- Statement of research problems
- Methodology
- Results and Discussion
- Conclusions
- Recommendations
- References

# **Background** of the study

- Nigeria's oil province, the Niger Delta, is situated on the continental shelf of West Africa.
- The Niger Delta Basin exhibits an upward transition ranging in age from early Tertiary to Recent, moving from marine pro-delta shales (Akata Formation) through a paralic (Agbada Formation) to a continental sequence (Benin Formation).
- AVG-1, which is part of OML-95, is located at latitude 5°30'20"N and longitude 4°30'48"E, northwest of the Niger Delta.

Part of West Africa and the Gulf of Guinea Showing Nigeria's Sedimentary Basin and In set is a map of Africa showing the Location of the Niger Delta region (Corredor *et al.*, 2005)

# **Statement of Research Problems**

- The research work published by STRATCOM committee and part of its objectives was to harmonize the biostratigraphy data of onshore and conventional offshore wells using foraminifera to unravel the geological information of the Niger Delta Basin Adegoke *et al.* (2017), however there still remain more to be done.
- □ Taxonomic usage of foraminifera for age determination in the Niger Delta still has some degree of knowledge deficiency and ambiguity.
- □ The problems in the application of the First Downhole Occurrence(FDO) and Last Downhole Occurrence(LDO) datum for biochronologic correlations.
- □ However, the biostratigraphy, sequence stratigraphy and palaeoenvironment of the present study well have not been documented. This research would contribute to the already existing knowledge Northwest of the Niger Delta Basin.

# **Aim and Objectives**

The project aim to integrate the palaeoenvironment, sequence stratigraphy, and biostratigraphy of the sediments in the studied well. The objectives consist:

- Describe the lithostratigraphic framework.
- Provide an age and biostratigraphic zone proposal.
- **Establish the sequence stratigraphic framework.**
- Based on the microfossil assemblages, ascertain the paleoenvironment.

# METHODOLOGY

- **1. Materials**: ditch cutting samples and wireline logs. Eight (80) ditch cuttings samples from AVG–1 well (830–5580ft interval) were sampled at 30ft for foraminifera studies respectively.
- 2. Methods
- □ Lithostratigraphy
- □ Foraminifera Sample Preparation
- □ Biostratigraphic method
- □ Sequence Stratigraphy
- □ Paleoenvironmental analysis: paleobathymetry and paleosalinity

# **RESULTS AND DISCUSSION**

#### Lithostratigraphic Units

- □ Sandstone: milky white to glassy, fine to coarse grained, sub-angular to sub-rounded, angular, poorly sorted to well sorted, and some carbonaceous fragments.
- □ Shale: Brownish to greyish, flaggy to platy, fissile, carbonaceous. Rare occurrences of ferruginous materials, mica flakes, pyrite, gluconite pellets and rare shell fragments.

# **Micropaleontological Data**

- Foraminifera Microfauna:Foraminiferal recoveries were generally good, well preserved and with a high diversity.
- Planktonic foraminifera such as; *Catapsydrax stainforthi, Orbulina universa, Globigerinoides bulloideus, Globorotalia mayeri* and *Globorotalia continuosa.* Showed the age of the study well to be Early to Late Miocene (N6-N17).

Biostratigraphic range chart of planktonic foraminifera for AVG-1 well.

Biostratigraphic range chart of Benthonic foraminifera for AVG-1 well.

# **Depositional sequence**

Three depositional sequences were recognized in the study well. The depth summary of the depositional sequences is presented in Table 1.

Table 1: Depth summary of sequence present in the study well

Sequence	Depth Range (ft)	Age
Sequence 1	5580-4370	Early Miocene
Sequence 2	4370-3500	Early Miocene to Middle Miocene
Sequence 3	3500-2300	Middle Miocene to Late Miocene

## Associated key surfaces

- □ Maximum Flooding Surface (MFS); at 5220ft (16.0Ma), 4150ft (11.6Ma) and 3250ft (9.2Ma)
- **Sequence Boundaries (SB)**; at 4370ft (15.5Ma), 3500ft (10.5Ma) and 2300ft (8.5Ma).
- □ Sedimentary cycle interpretation ; based on the ages of the three MFS correlated to Haq *et al.*, (1988) chronostratigraphic chart, reveals that the studied well interval went through three cycles of deposition: Early (Cycle 7), Middle Miocene (Cycle 9) and Late Miocene (Cycle 10).

Sequence Stratigraphy Chart of AVG-1well.

# Paleobathymetry

- □ **Transitional environment:** high sand ratio (high-energy environment). *Amphistegina lessonii* and *Quinqueloculina microcostata*
- □ Inner neritic-middle neritic environment: sandstone and high shale ratio, mica flakes, pyrite, glauconite pellets and ferruginous materials(supports a low-energy shallow marine environment). *Ammonia beccarii, Cibicorbis inflata* and *Florilus atlanticus,*
- □ Outer Neritic: presence of planktonic foraminifera such as *Globigerinoides* sp., *Catapsydrax stainforthi*, *Uvigerina sparsicostata* and *Brizalina mandoroveensis*.

Paleoenvironment Chart of AVG-1well.

**Paleoesalinity interpretations;** The triangular plots reveal the dominance of the hyaline calcareous (over 90%) shell type suggesting a normal marine shelf sea environment.

Triangular plots of shell-type ratio within the study well.

# **Research contribution to knowledge**

- □ The micropalaeontologic and lithological description showed that the sediments for the study interval belong to the Early to Late Miocene paralic Agbada Formation. The biozones that were proposed, correlates to standard Mid-latitudinal zones.
- □ The GR log and microfossils abundance revealed three episodes of sea level rise and fall, influenced by eustacy and regional tectonics within the Niger Delta during the Miocene.
- □ The foraminiferal bathymetric ranges of: *Haplophragmoides narivaensis*, *Ammonia beccarii*, *Lenticulina inornata*, *Uvigerina subperegrina*, *Eponides eshira* and wall composition triangular plot, which showed the dominance of the hyaline calcareous (over 90%). These revealed that the sediment deposition occurred within a shallow to inner shelf settings.

# Plate I

All the foraminifera species illustrated in Plate I (adapted from Adegoke *et al.*, 2017) .Were collected from AVG-1 Well, Niger Delta. Below is the species name, corresponding depth of occurrence and magnification.

- 1. Florilus atlanticus (Cushman, 1947), (3110-3350ft), side view ×175.
- 2. Florilus costiferum (Cushman, 1926),(3110-4900ft), side view (×200)
- 3. Amphistegina lessonii (d'Orbigny, 1826),(1370-5209ft),(×55)
- 4. *Eponides eshira* (de Klasz and Rerat, 1962), (3890-5480ft), umbilical view, (×175)
- 5. *Lenticulina grandis* (Cushman 1927),(3770-5510ft) apertural view, (×500)
- 6. *Lenticulina inornata* (d'Orbigny, 1846),(2850-3170ft), apertural view, (×75)
- 7. Uvigerina subperegrina (Cushman and Kleinpell, 1934),(2850-5209ft), side view, ×500.
- 8. Uvigerina sparsicostata (Cushman and Laiming, 1931; LeRoy, 1944), (4190-5580ft), side view, ×260
- 9. Globigerinoides extremus (Bolli and Bermudez, 1965), (4010ft) umbilical view, (×300)
- 10. *Globigerinoides obliquus* (Bolli, 1957), (2850-4930ft) umbilical view, (×182)
- 11. Globigerinoides primordius (Blow and Banner, 1962), (4930-5580ft) spiral view, (×149)
- 12. Bolivina mandoroveensis (Graham, de Klasz, and Rerat, 1965) (3900-5360ft), side view, ×300.
- 13. Eponides eshira (de Klasz and Rerat, 1962), (3890-5480ft), umbilical view, (×175)
- 14. Hanzawaia strattoni (Applin, 1925), (1370-4310ft), ventral view, ×500.
- 15. Catypsydrax stainforthi (Bolli, Loeblich and Tappan, 1957), (4250-4930ft) × 214
- *16. Cibicorbis inflate* (d'Orbigny, 1846), (3110-5200ft) × 200.
- 17. Haplophragmoides narivaensis (Bronnimann, 1953), (950-4620ft) ×225

# Plate II

All the foraminifera species illustrated in Plate II (adapted from Adegoke *et al.*, 2017) .Were collected from AVG-1 Well, Niger Delta. Below is the species name, corresponding depth of occurrence and magnification

- 1. *Alveolophragmium crissum* (Shchedrina, 1936), (3770ft) ×330.
- 2. *Poritextularia Pananemsis* (Cushman, 1918), (2270ft) side view, ×50.
- 3. *Ammobaculites agglutinans* (d'Orbigny, 1846), (2270ft) ×100.
- 4. *Quinqueloculina microcostata* (Natland, 1938), (1370-3900ft) side view, ×160.
- 5. *Spirosigmoilopsis oligocaenica* (Parr, 1942), (3410-5200ft), side view, ×450.
- 6. *Nonion centrosulcatum* (de Klasz, Le Calvez, and Rerat, 1964), (3910-5540ft), side view, ×275.
- 7. Bolivina beyrichi (Reuss, 1851), (3470-3590ft) side view, ×420.
- 8. *Brizalina imperatrix* (Graham, de Klasz, and Rerat, 1965), (3330-5200ft), side view, ×225.
- 9. Valvulineria sp (Cushman, 1926), (3950-5540ft) spiral view, ×480.
- 10. Ammonia beccarii (Linne, 1758), (1370-4960ft) umbilical view, ×300.
- 11. *Heterolepa pseudoungeriana* (Cushman, 1922), (2700-5209ft) umbilical view, ×150.
- 12. Turborotalia obesa (Bolli, 1957),(3320-5540ft) umbilical view, ×325
- *13. Globigerinoides bulloideus* (Crescenti, 1966), (1370-4250ft) umbilical view, ×130.
- 14. Orbulina universa (d'Orbigny, 1839), (2850-4730ft) side view, ×150.
- 15. Altistoma scalaris (de Klasz and Rerat, 1962), (4130-5140ft) side view, ×200.
- 16. Praeglobobulimina ovate (d'Orbigny, 1846), (4130ft) side view, ×200.
