## The CrIS NASA L1B Project and Products

The goal of the NASA CrIS Level 1B project is to support NASA climate research by providing a climate quality Level 1B (geolocation and calibration) algorithm and create long-term measurement records for the CrIS instruments currently on-orbit on the SNPP, JPSS-1 (NOAA-20), and JPSS-2 (NOAA-21) satellites, and for those to be launched on JPSS-3 and JPSS-4.

- The long-term objectives of the project include:
- Create well-documented and transparent software that produces climate quality CrIS Level 1B data to continue or improve on EOS-like data records, and to provide this software and associated documentation to the NASA Sounder Science Investigator-led Processing System (SIPS).
  - Provide long-term monitoring and validation of the CrIS Level 1B data record from SNPP and JPSS-1 through JPSS-4, and long-term maintenance and refinement of the Level 1B software to enable full mission reprocessing as often as needed.
  - Provide a homogeneous radiance product across all CrIS sensors through the end of the CrIS series lifetime, with rigorous radiance uncertainty estimates.
  - Develop and support of the CrIS/VIIRS IMG software and datasets, which provide a subset of Visible Infrared Imaging Radiometer Suite (VIIRS) products that are co-located to the CrIS footprints.
  - Develop and support of the Climate Hyperspectral Infrared Product (CHIRP) for the AIRS and CrIS sounders. The CHIRP product converts the parent instrument's radiances to a common Spectral Response Function (SRF) and removes inter-satellite biases, providing a consistent inter-satellite radiance record.

The NASA CrIS products are available via the NASA Goddard Earth Sciences (GES) Data and Information Services Center (DISC) at <https://www.earthdata.nasa.gov/sensors/cris>

### Key Features of a Climate Data Record

**Climate Data Record (CDR)**

"A time series of measurements of sufficient length, consistency, and continuity to determine climate variability and change" (US National Research Council, 2004)

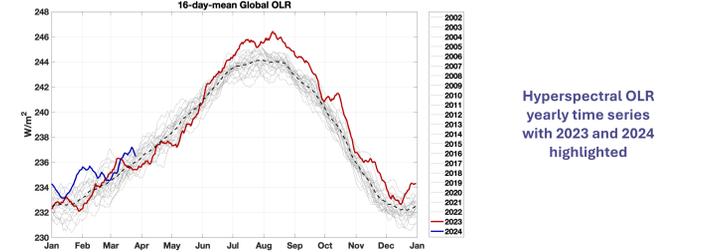

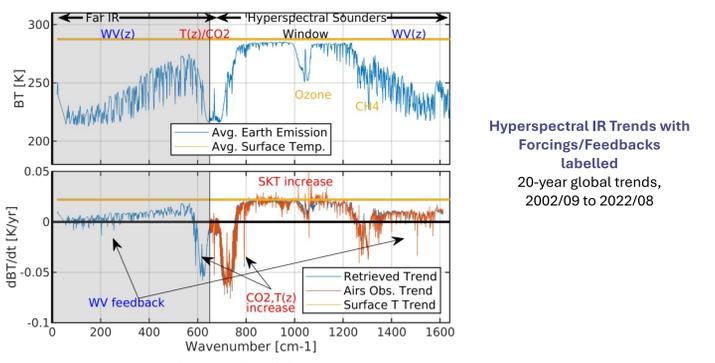

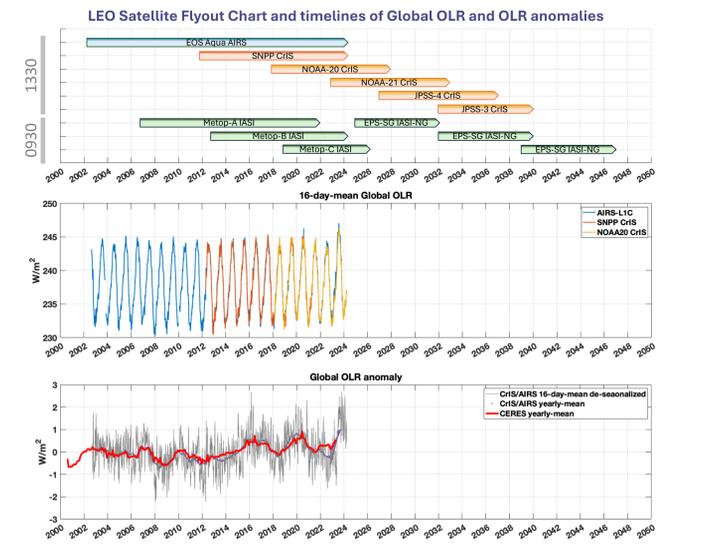

- Continuity:** If an Earth measurement exists when the quality of the measurement for a specific defined Earth science objective is maintained over the required temporal and spatial domain set by the objective.
- Quality:** Is characterized by the combined standard uncertainty, which includes instrument uncertainty, repeatability, time and space sampling, and data systems and delivery for climate variables (algorithms, reprocessing, and availability).
- Consistency:** Requires that instruments introduced to continue an existing CDR produce "inter-compatible" measurements that allow continuation of the CDR without introducing discontinuities in the record.

Since there is no standard for CDR, it is challenging to compare multiple independent inter-comparisons involving both satellite and surface/in-situ measurements are needed.

## Climate: OLR, INR, and Spectral Radiance Trending

## Climate Hyperspectral Infrared Product (CHIRP)

- Level 1b Hyperspectral Data Continuity Product
- Will allow inter-instrument radiance trending and a common input for climate-oriented Level 2 retrieval algorithms
- Goal: Hyperspectral radiances that span AIRS, CrIS, (and potentially IASI and HIRAS) with common:
  - Spectral sampling and spectral shape (ILS/SRF)
  - Radiometric calibration
  - Radiative Transfer Model
  - File format (based on CrIS NASA L1b file format)
- Essential for providing a long-term Level-3 radiance data set of climate quality
- A simpler dataset for users in 20+ years
- Spectral Sampling: LW: 0.625, MW: 0.833, SW: 1.250 cm<sup>-1</sup> (MOPD: 0.8, 0.6, 0.4 cm)

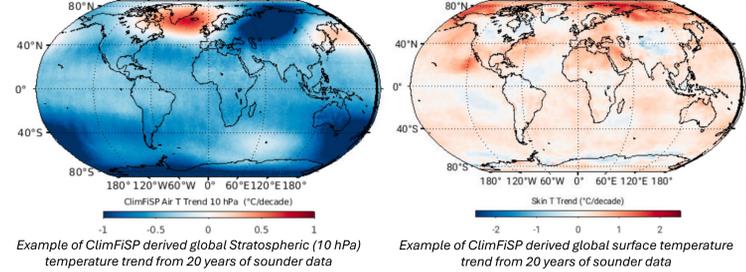

A Climate Hyperspectral Infrared Radiance Product (CHIRP) Combining the AIRS and CrIS Satellite Sounding Record, Strow et al, <https://doi.org/10.3390/rs13030418>

AIRS Deconvolution and the Translation of AIRS-to-CrIS Radiances With Applications for the IR Climate Record, Motteler et al, <https://doi.org/10.1109/TGRS.2018.2869170>

## Example Applications and Related Products

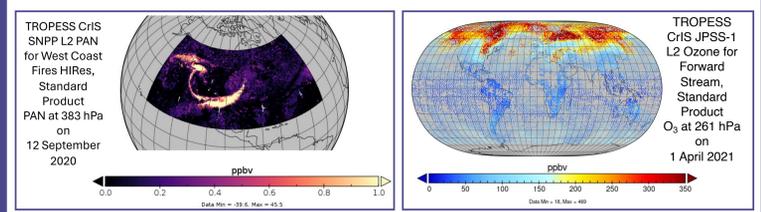

### Climate Fingerprinting Sounder Products (ClimFISP)

- Remote Sensing of Atmospheric Temperature, Water Vapor, Trace Gases, Cloud, and Surface Properties on Daily and Decadal Time Scales, Xu Liu et al. (Thu, 18 Apr | EGU24-2925 | AS3.29)
- Works on spatiotemporally averaged radiance spectra
- The ClimFISP algorithm has been applied to CHIRP data from 2003-2022

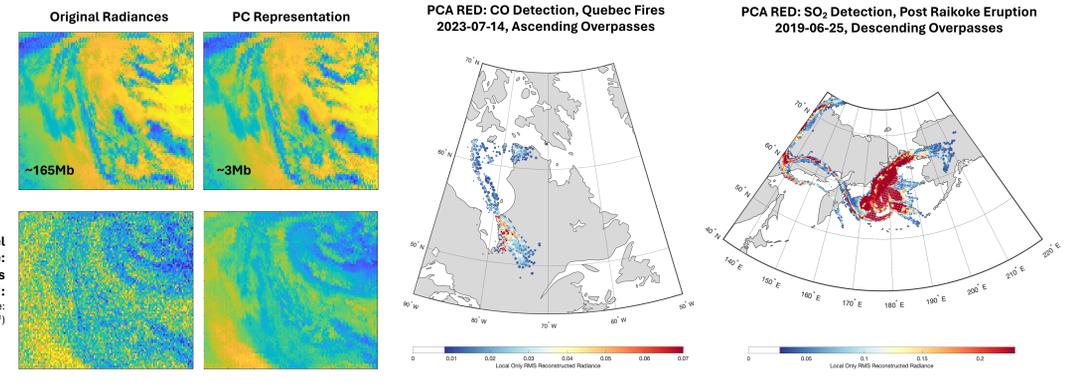

### Tropospheric Ozone and its Precursors from Earth System Sounding (TROPESS)

- Quantification and evaluation of TROPESS ozone trends, Pennington et al. (Wed, 17 Apr | EGU24-13520 | AS3.15)
- Using Machine Learning to Predict Column Concentrations and Retrieval Diagnostics of the TROPESS Atmospheric Composition Profiles, Werner et al. (Wed, 17 Apr | EGU24-21179 | AS3.30)
- <https://disc.gsfc.nasa.gov/information/mission-project?title=TROPESS>

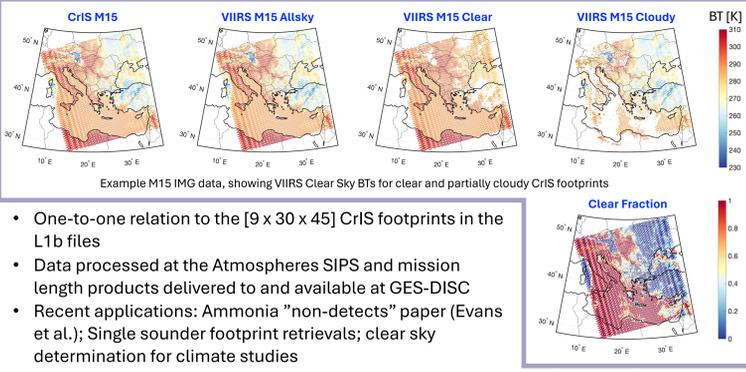

### CrIS PCA RED (Rapid Event Detection)

- Adapted the EUMETSAT Hybrid PCA technique to CrIS
  - e.g.: Hultberg et al. 2017
  - Currently available for IASI, and will be used for IASI-NG and MTG-IRS
  - Sample data for JPSS-1 (NOAA-20) CrIS now available via GES-DISC (including forward processing)
- Benefits
  - Data compression (52x)
  - Data accessibility
    - Preparing for future sensors
  - Random Noise Filtering (~78%)
  - Rare/Rapid Event Detection (25 species/spectral regions)

### CrIS/VIIRS IMG

- A "value added" product, that provides VIIRS to CrIS footprint collocation information in small, easy to use files with common file granulation to the NASA VIIRS and CrIS L1b products
- Collocate CrIS FOVs with VIIRS Cloud Mask and Radiances/Reflectances
- For each CrIS and corresponding VIIRS L1B granule, CrIS/VIIRS collocation is performed, and the indices of VIIRS pixels within each CrIS footprint are written to an imager to sounder collocation file (IMG\_COL, 12-15 MB per file)
- A corresponding IMG file is also produced, containing statistics of the VIIRS (MVCM) cloud mask and VIIRS radiances and reflectances that have been collocated within each CrIS footprint (IMG, ~6 MB per file)

- One-to-one relation to the [9 x 30 x 45] CrIS footprints in the L1b files
- Data processed at the Atmospheres SIPS and mission length products delivered to and available at GES-DISC
- Recent applications: Ammonia "non-detects" paper (Evans et al.); Single sounder footprint retrievals; clear sky determination for climate studies
- Potential future work, pending priorities and resources, to add additional collocated variables:
  - VIIRS cloud height, aerosols, etc.
  - Surface temperature and emissivity (CAMEL), re-analysis fields, carbon tracker, etc.
  - Create the same product for AIRS/MODIS

## The Cross-track Infrared Sounder (CrIS)

The Cross-track Infrared Sounder (CrIS) is an infrared Fourier Transform Spectrometer onboard the Suomi-NPP (SNPP), JPSS-1, and JPSS-2 satellites (and on the to be launched JPSS-3 and JPSS-4 satellites). The CrIS instrument was designed to provide an optimum combination of optical performance, high radiometric accuracy, and compact packaging. While CrIS was developed primarily as a temperature and water vapor profiling instrument for weather forecasting, its high accuracy and extensive information about trace gases, clouds, dust, and surface properties make it a powerful tool for climate applications.

## Radiometric Uncertainty

- A critical aspect of a reference sensor and climate quality measurement record is the documentation of and ability to calculate the uncertainty in the sensor measurement.
  - A complete measurement includes the best estimate and its uncertainty
- The radiometric uncertainty (RU) in the calibrated radiance can be determined via a perturbation analysis of the calibration equation
  - Equivalent to a differential error analysis described in the GUM (Guide to Uncertainty in Measurements)
  - SNPP CrIS: Tobin, D., et al. (2013), *Suomi-NPP CrIS radiometric calibration uncertainty*, *J. Geophys. Res. Atmos.*, 118, 10,589-10,600, doi: 10.1002/jgrd.50809.
- The CrIS NASA L1B V3 product contains the information needed to accurately calculate the radiometric uncertainty for any CrIS NASA L1B calibrated radiance
- Radiometric Uncertainty Tool documentation, sample code, and static RU parameters are available via the GES DISC L1b landing pages ('NASA Cross-track Infrared Sounder (CrIS) Level 1B Radiometric Uncertainty Description Document, v3')

Due to this Radiometric Uncertainty capability, the NASA CrIS L1B product is being used as a verification data source in the development of ERA6
