# Introduction

## Introduction

## Study Area

## Methodology

## Results

## Conclusions

- Groundwater is one of the most important and vital natural resource which is stored in the subsurface geological formation of earth's crust.
- In Ancient times, surface water was the primary source of water for various uses in India.
- With increasing population and variation in climatic condition, dependency on ground water has increased.
- Occurrence and distribution of groundwater mainly depends on various natural and anthropogenic factors.
- India is the largest groundwater user in the world, with an annual withdrawal of 230 km<sup>3</sup> for irrigation.

# Groundwater Potential Zone

## Introduction

- A Groundwater potential zone refers to an area where the conditions are conducive for the occurrence and movement of groundwater.
- Delineated Groundwater zone map can also be used to decide a location for drilled and dug wells for domestic and irrigation purposes.
- Various Factors affecting GWPZ-

## Study Area

## Results

## Conclusions

# Raipur District

Introduction

1. Raipur is the capital city of Chhattisgarh State.

2. The Raipur district is located on the Mahanadi river basin.

3. Raipur districts mostly have two types of soils, i.e., Sandy loam and sandy clay loam.

4. The Raipur districts Extends from latitude  $21^{\circ}23''$  to longitude  $81^{\circ}65''$ .

5. The total coverage area of Raipur district is  $2,892 \text{ km}^2$

**Figure 4:** Final Groundwater Potential Zone Map

# Analysis

**Figure 5:** Blocks of Raipur District

1. The Arang block shows a low groundwater potential zone due to the presence of impervious rock i.e., shale while the Raipur block is a highly urbanized area in the district leading to an impervious area hence the occurrence of a low groundwater potential zone.
2. The upper side of the Raipur district consists of Limestone which is highly permeable and shows a Good GW potential zone.

# Conclusions

Introduction

Study Area

Methodology

Results

Conclusions

- Groundwater potential zone, determined and identified by direct checking of hand drilling, is a costly and time-consuming activity hence RS and GIS an effective tools for efficiently mapping groundwater potential zones which is efficient and also time-saving.
- The poor potential zones are mainly distributed in the areas having high drainage density. Hence, the groundwater potential in these areas could not be sufficient for irrigation and other livelihood requirements.
- Results indicated that the southern and eastern part of the study area falls under a poor GWP zone due to the presence of unfavorable conditions for groundwater occurrence and needs for proper groundwater management and planning in these areas is needed to improve the groundwater level.
