## RESEARCH MOTIVATION

Water Use Efficiency (WUE) is a key ecohydrological trait, defined as the ratio of carbon assimilation to water losses, and can be represented at various spatial scales. In spite of huge cultivation and water use, crop water productivity (0.46 kg of lint/m<sup>3</sup>) of Indian Cotton is far below the world averages (0.95 kg of lint/m<sup>3</sup>). Effective quantification and scaling relations in WUE helps in understanding the carbon-water exchanges for effective management of resources and improving the yield.

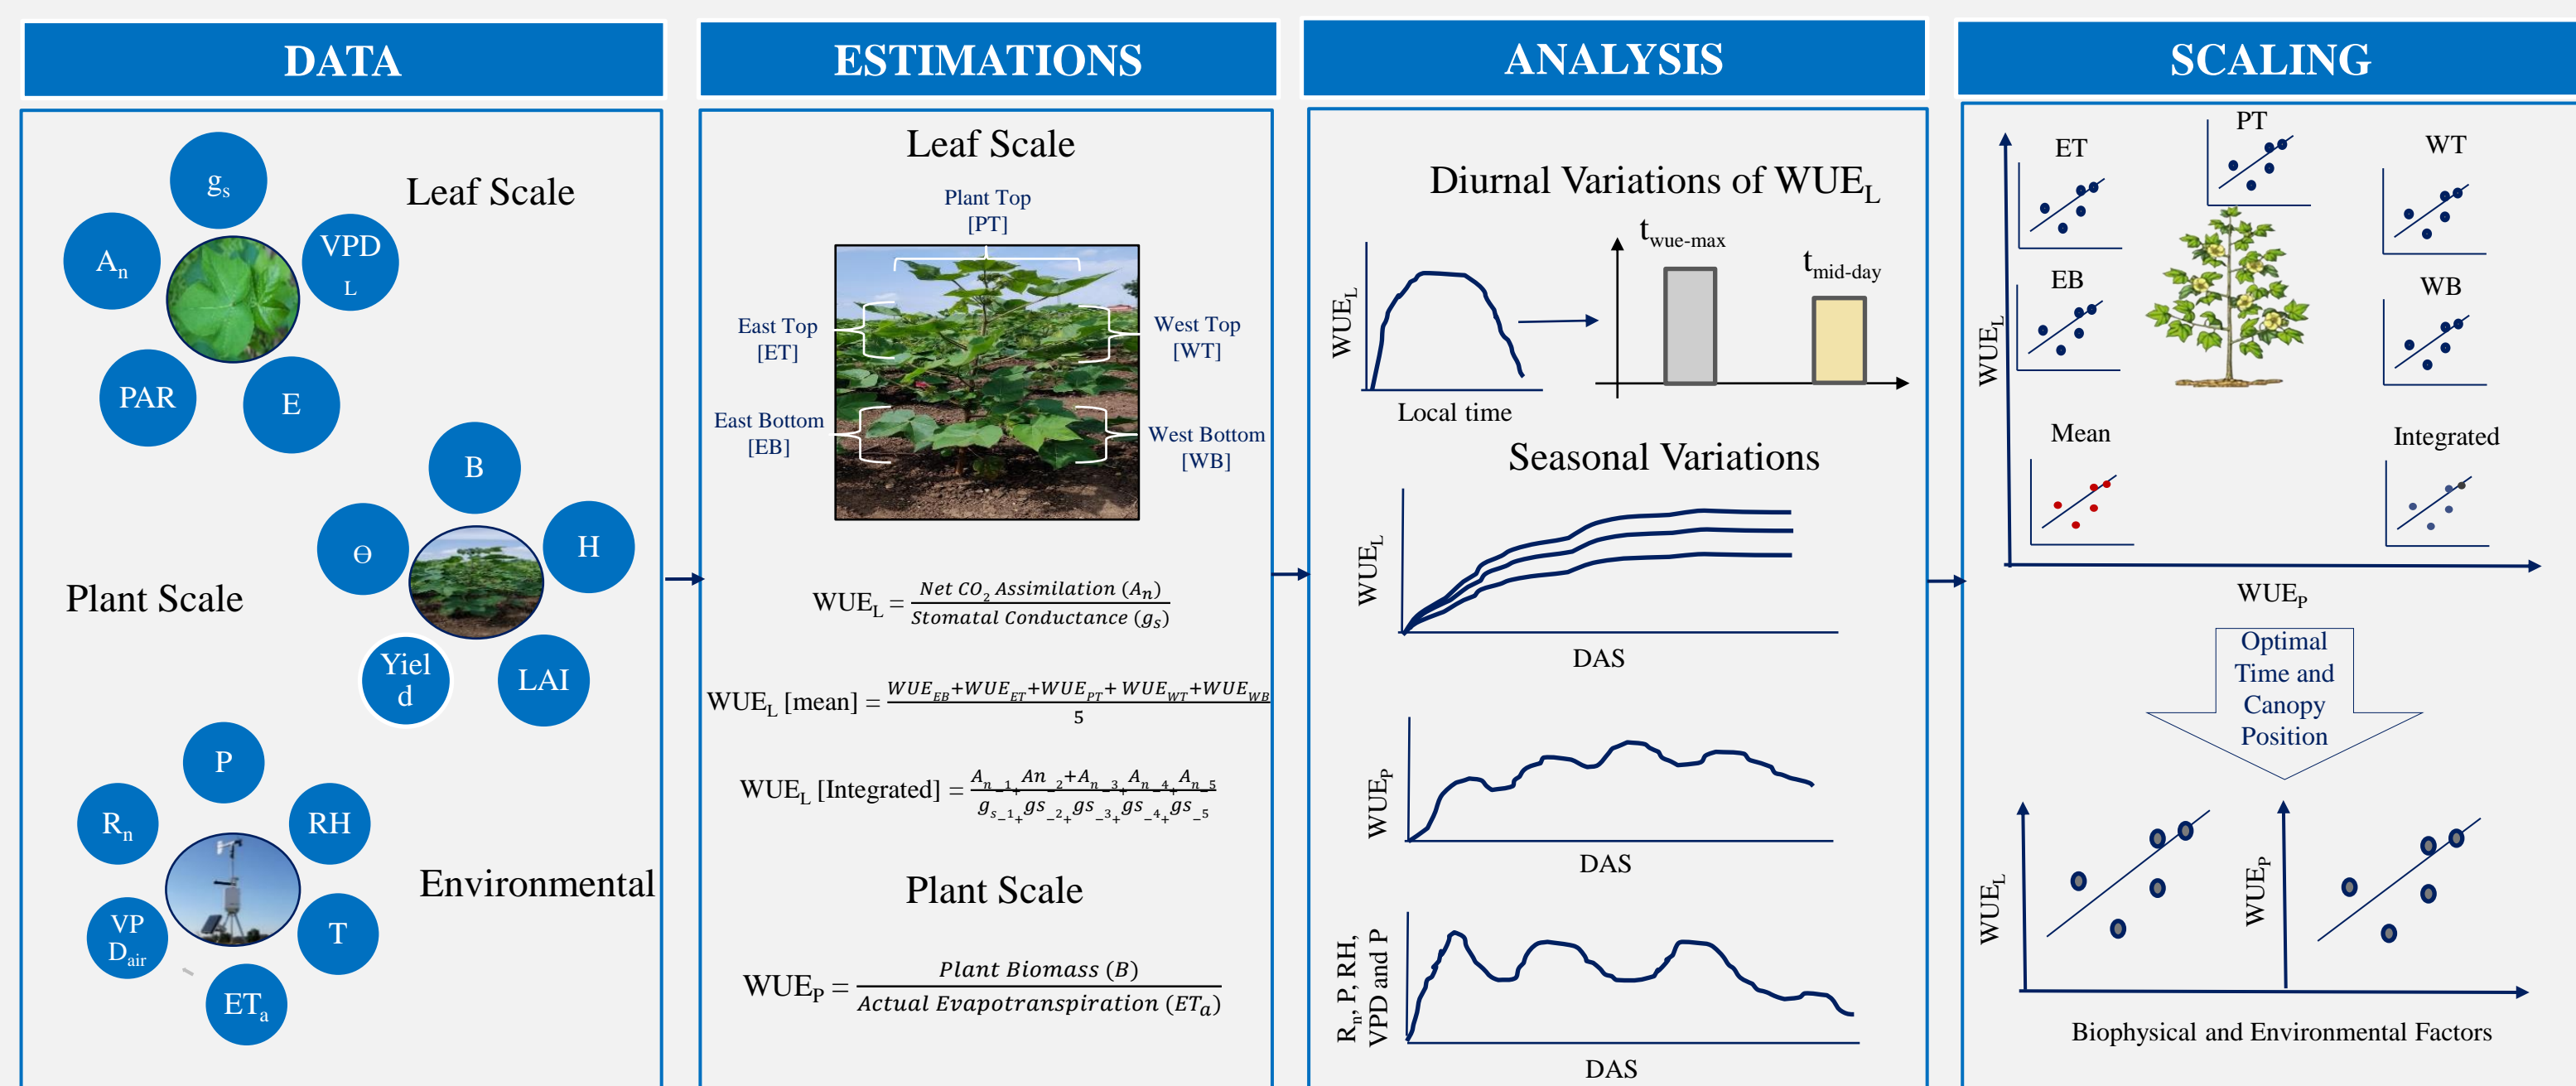

### Research Objectives

- ❖ Establish scaling relations between leaf (WUE<sub>L</sub>) and plant (WUE<sub>P</sub>) WUE in rainfed Cotton.
- ❖ Identify optimal time-window and leaf position to measure and upscale WUE<sub>L</sub>.
- ❖ Understand the role of various environmental and biophysical factors on WUE<sub>L</sub> and WUE<sub>P</sub> dynamics.
- ❖ Assess the contribution of canopy positions to whole-plant carbon and water fluxes.

**Fig 1:** Geographical location of the study area

## METHODOLOGY

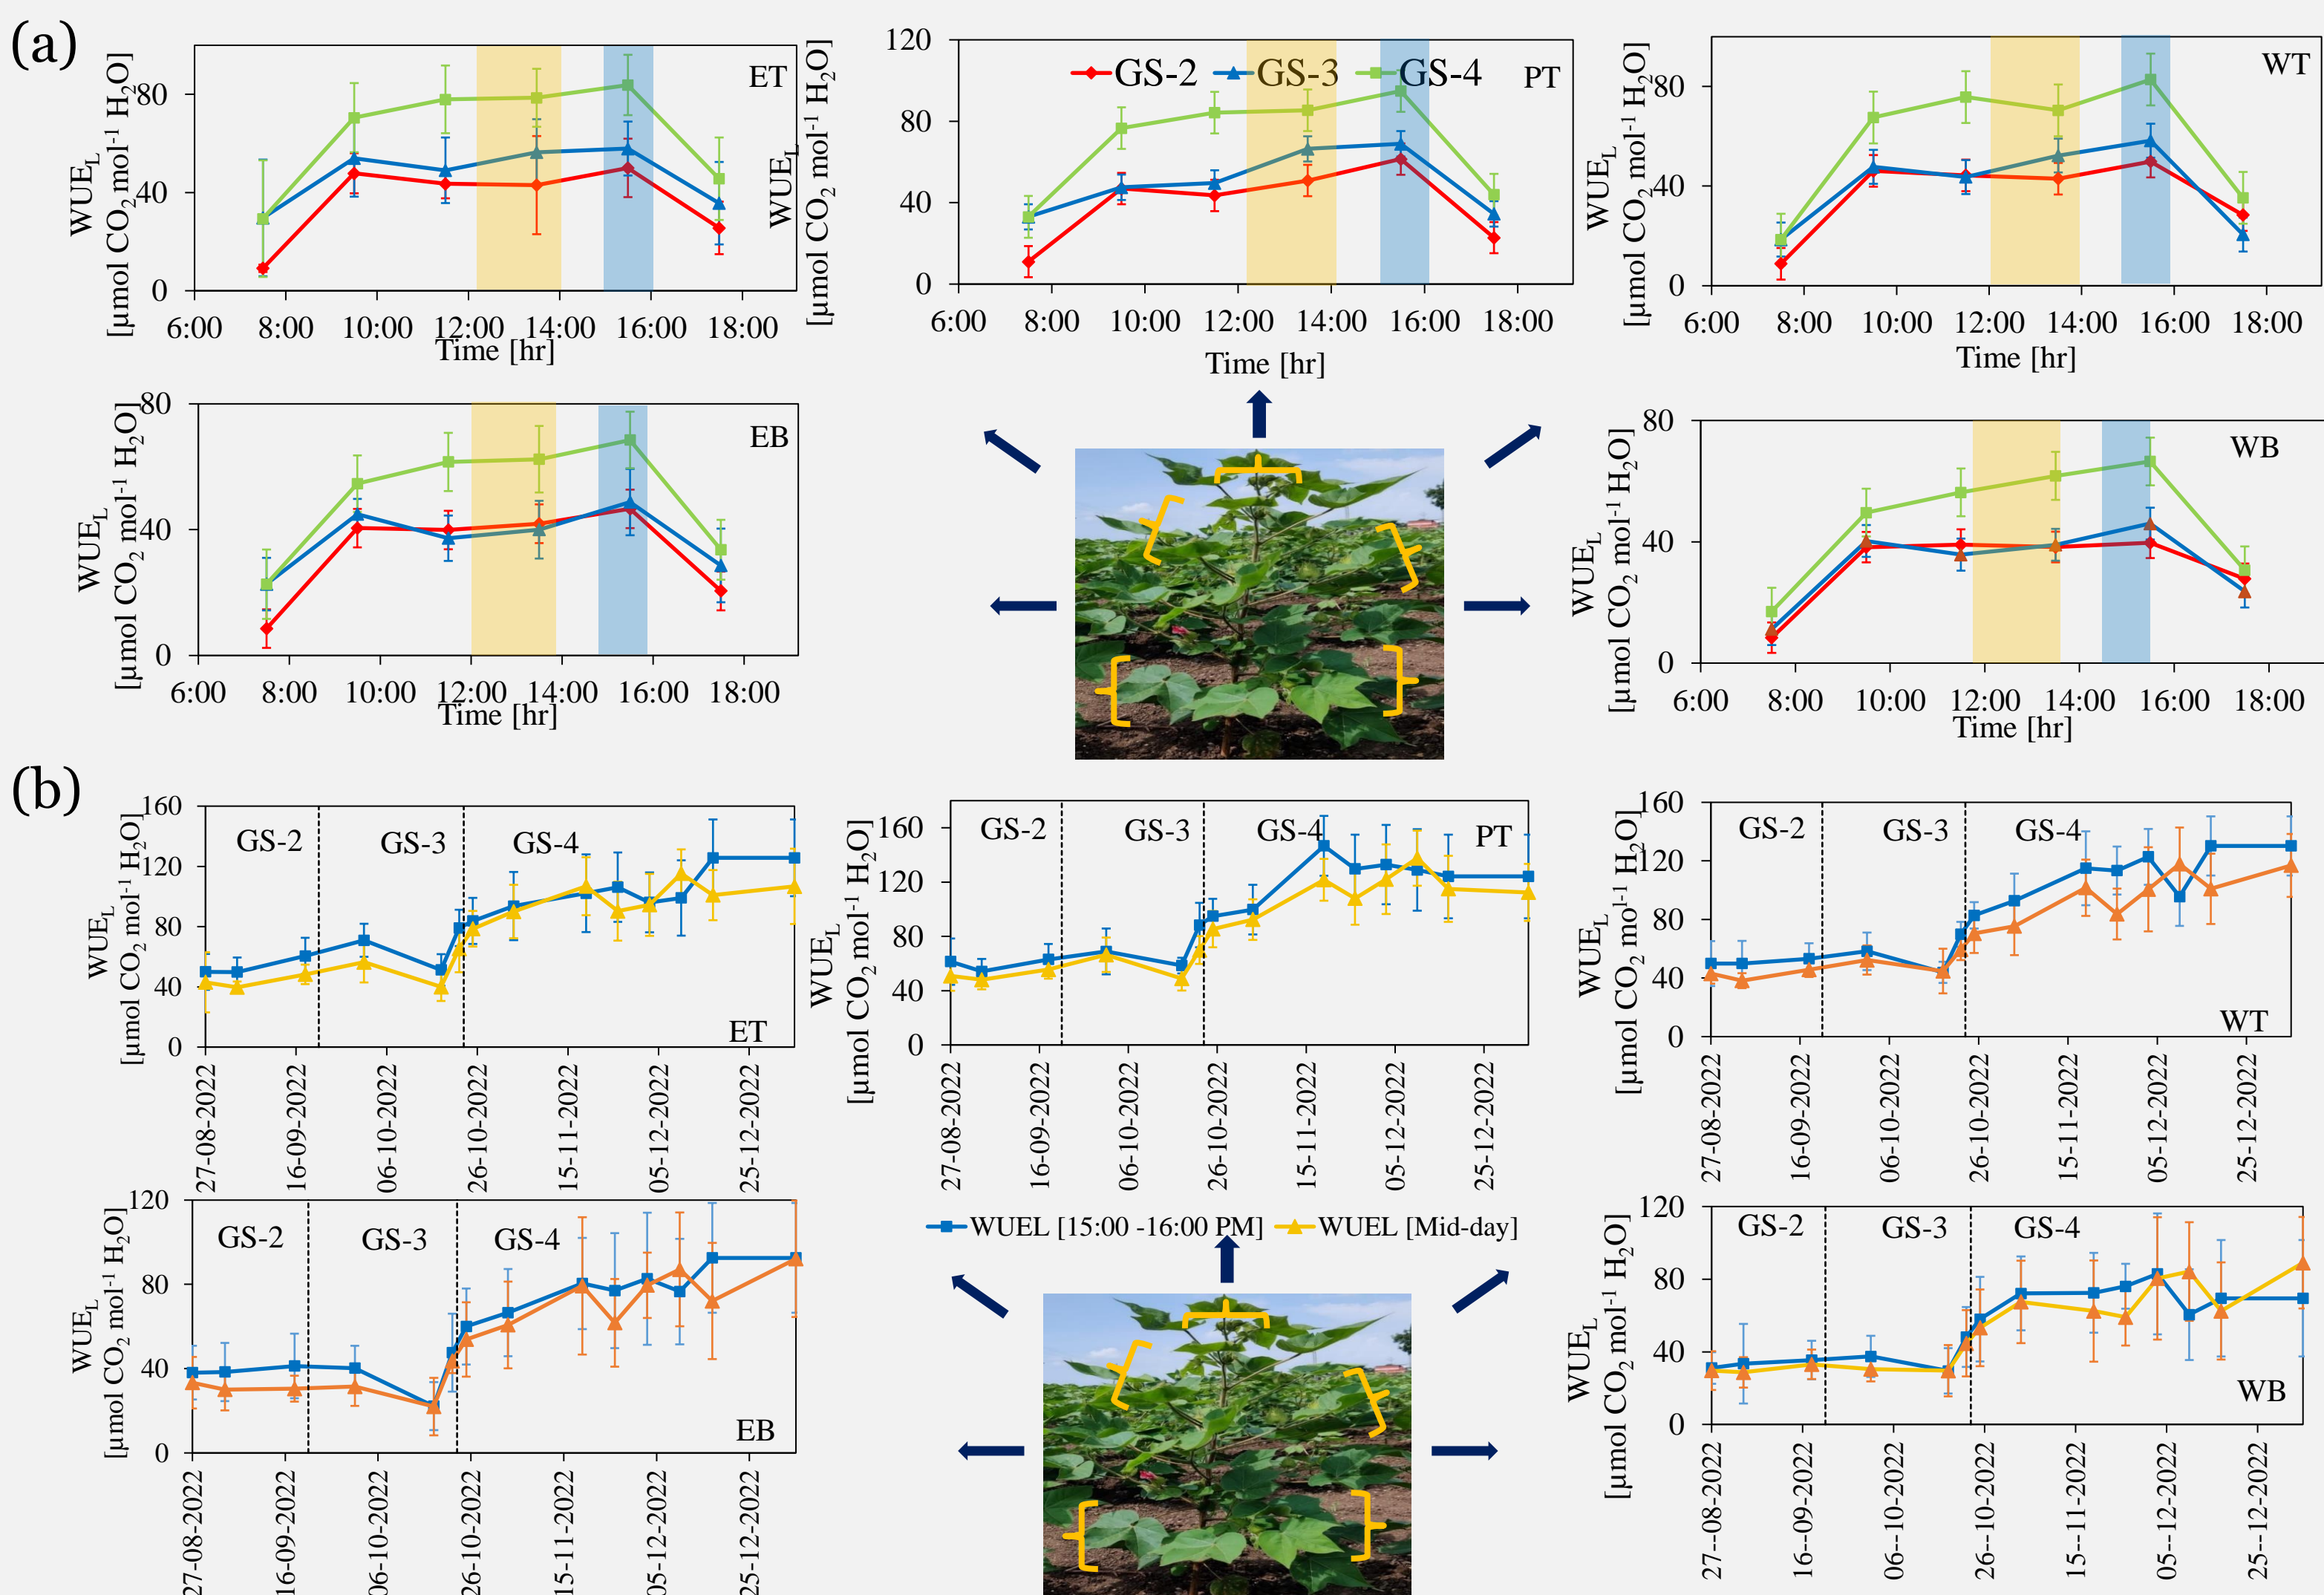

**Fig 2:** Flowchart illustrating the methodology followed in this research to quantify and upscale WUE<sub>L</sub>

## FIELD EXPERIMENTATION [DATA COLLECTION]

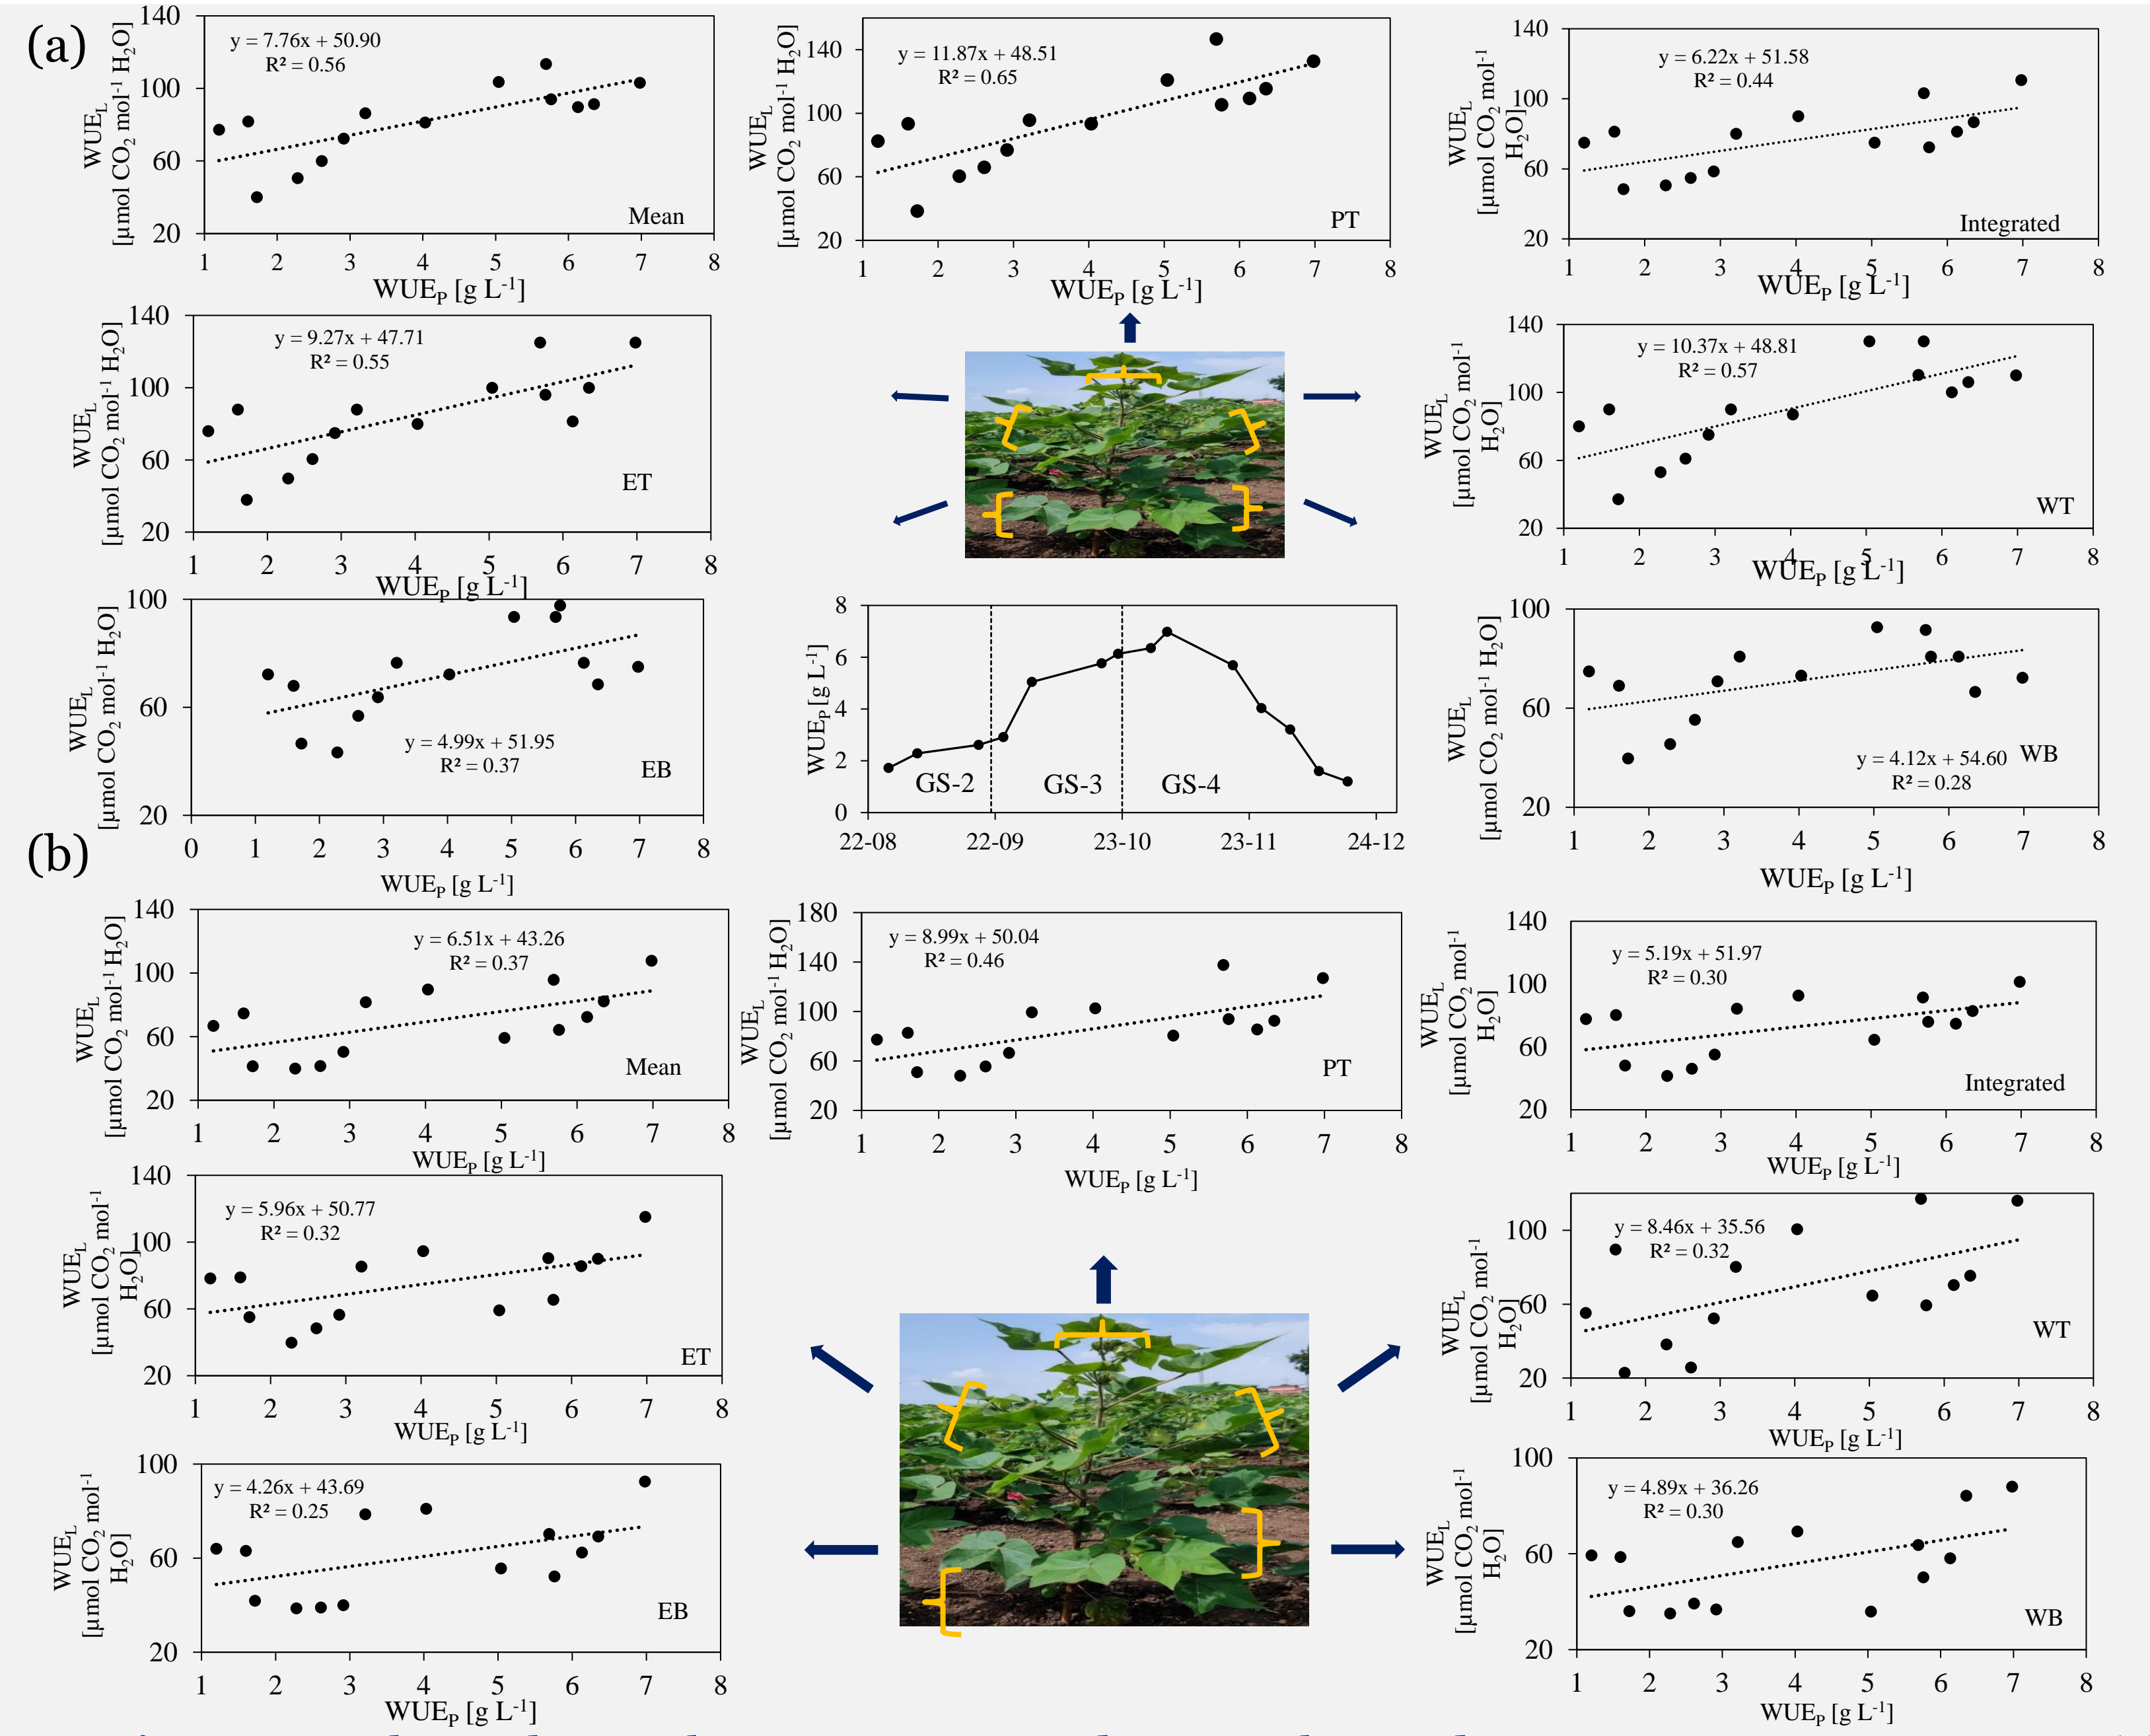

## WUE DYNAMICS

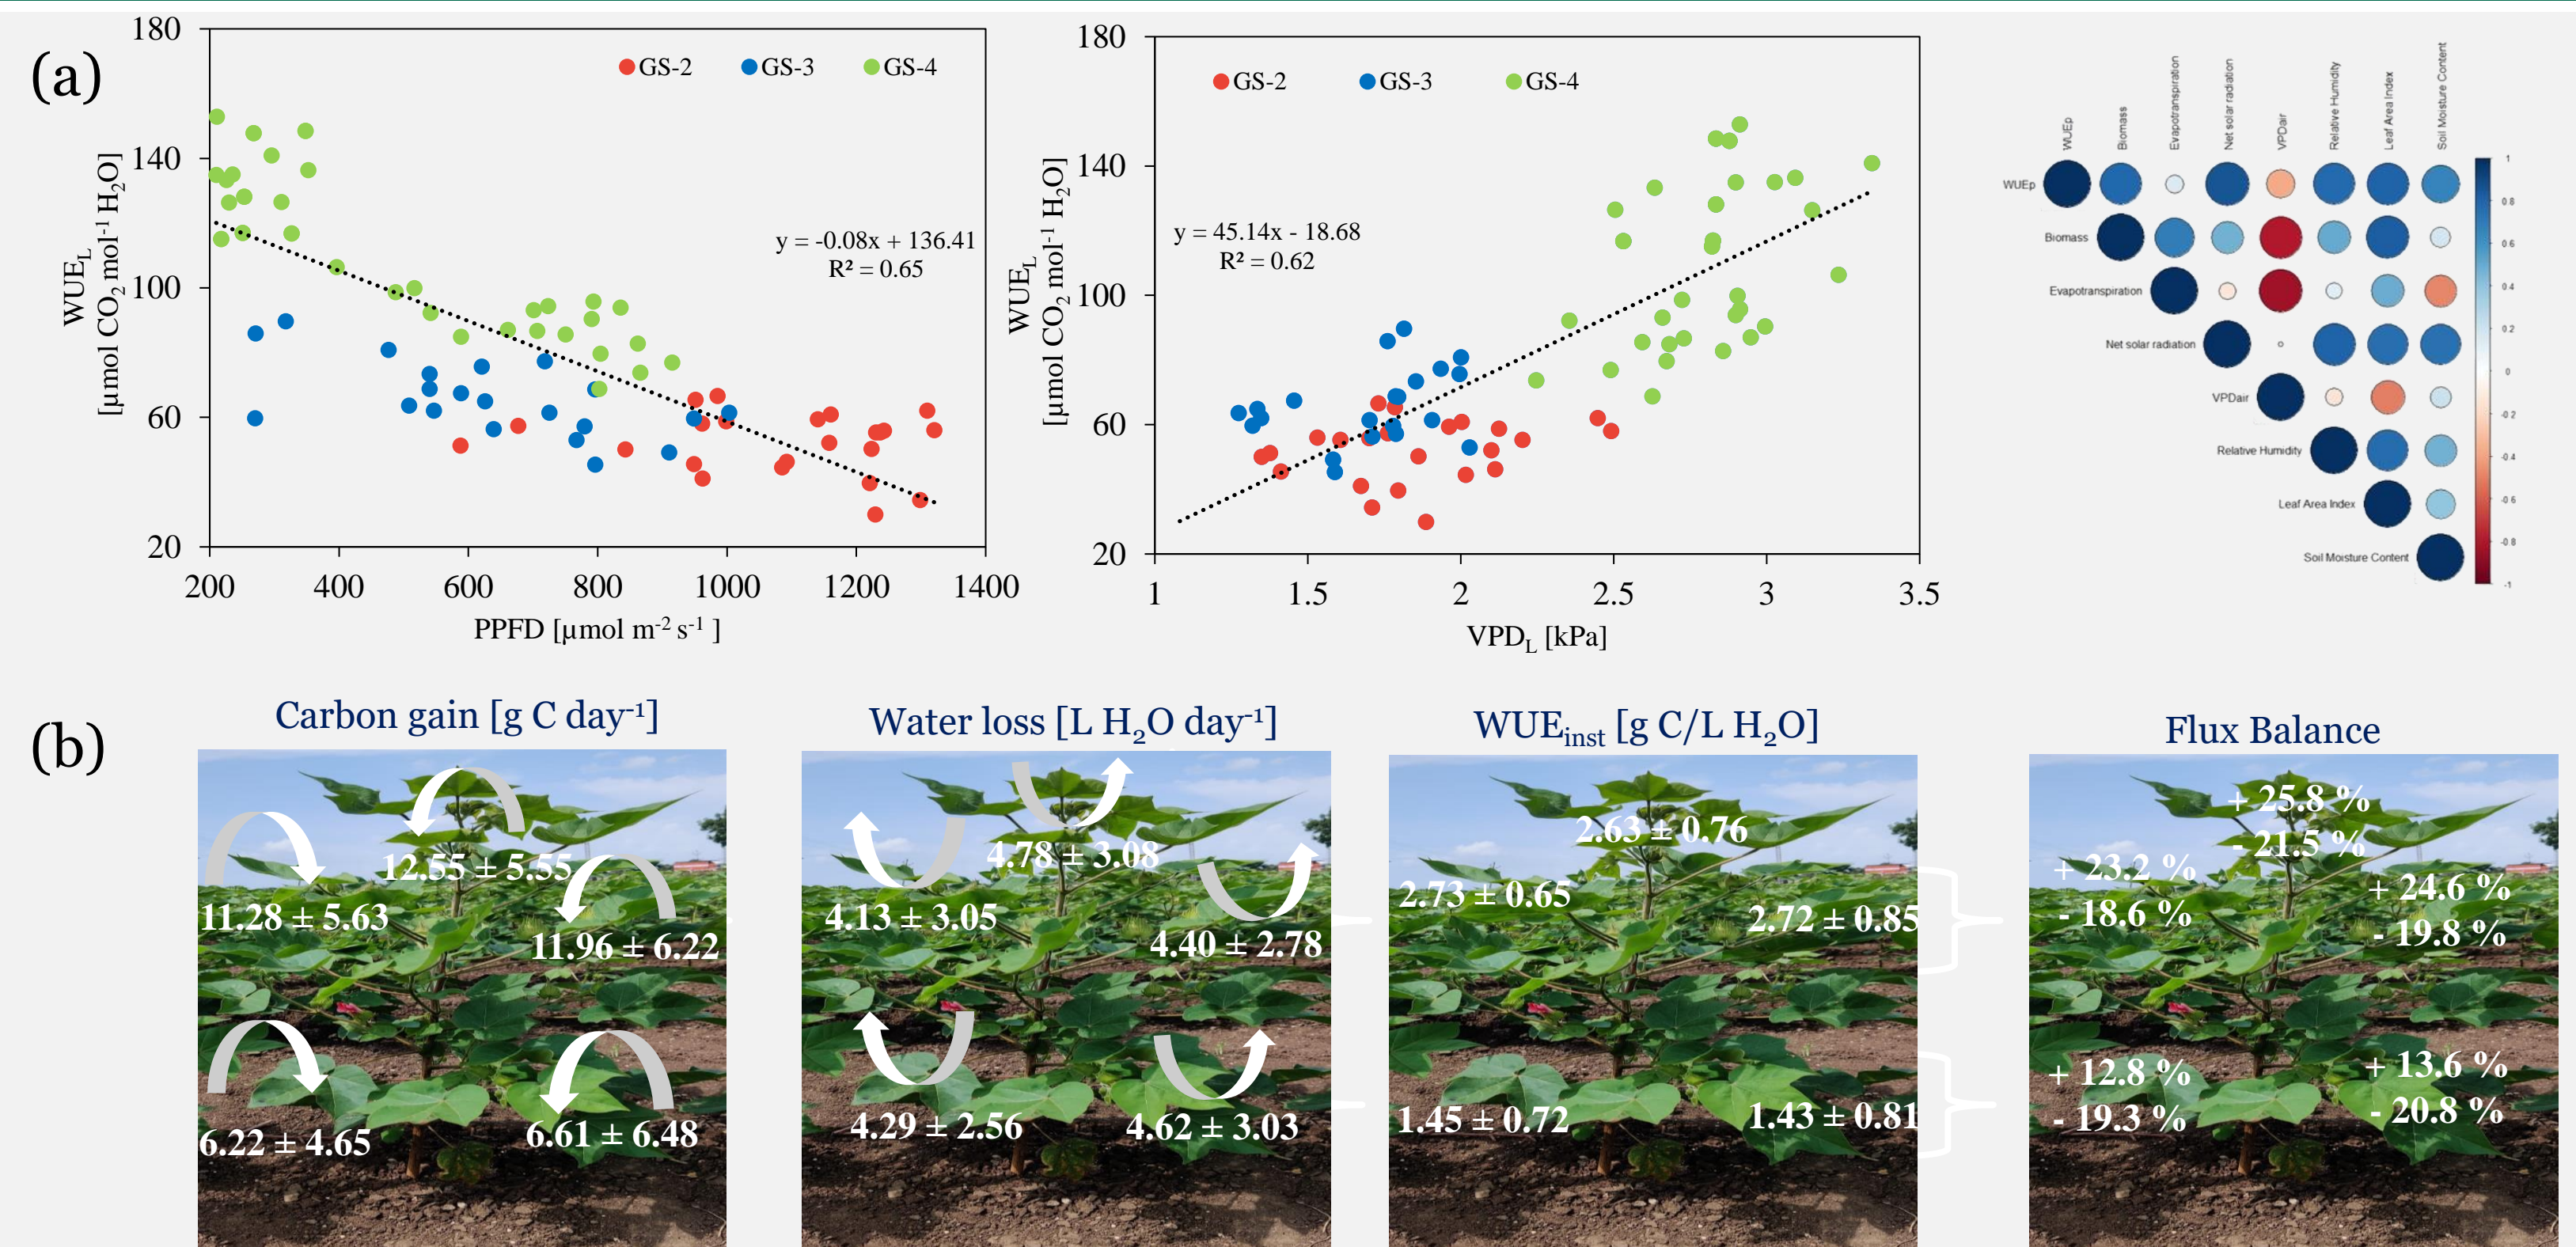

**Fig 3:** Diurnal (a) and seasonal (b) variations in WUE<sub>L</sub> across five canopy positions during different growth stages of rainfed Cotton.

## WUE SCALING RELATIONS

**Fig 4:** Upscaling relations between WUE<sub>L</sub> and WUE<sub>P</sub> observed in  $t_{max\_wue}$  i.e. 15:00 – 16:00 (a) and  $t_{midday\_wue}$  i.e. 12:00 – 13:00 (b) time windows

## EXTERNAL DRIVERS ON WUE

**Fig 5:** Association between PPFD and VPD<sub>L</sub> on WUE<sub>L</sub> and Correlation matrix between various external drivers with WUE<sub>P</sub> (a); distribution of carbon gain, water loss, and their ratio WUE<sub>L</sub> fluxes (b) within the canopy.

## CONCLUSIONS

- ❖ Plant Top [PT] canopy position and time corresponding to maximum WUE<sub>L</sub> [ $t_{max\_wue}$ ] i.e., 15:00 to 16:00 hours are the optimal canopy position and optimal time window to measure WUE<sub>L</sub>.
- ❖ WUE<sub>L</sub> was significantly influenced by the measured PPFD [ $r = 0.80$ ] and VPD<sub>L</sub> [ $r = 0.78$ ] whereas the WUE<sub>P</sub> was influenced by  $R_n$  [ $r = 0.85$ ] and RH [ $r = 0.77$ ].

## FUTURE STEPS

- ❖ Multi scale characterization of WUE of Maize crop.
- ❖ Investigate the WUE scale issues under Indian –agro climatic conditions.
- ❖ Investigate the role of climate and biophysical drivers on various scales of WUE dynamics.
- ❖ Development of WUE model for estimating ecosystem WUE using observed eddy-covariance flux datasets.
