

Looking for contributes

One on the main objectives of this initiative is to "*make visible the invisible*" hidden within minerals and rocks. To this aim, we need the best examples, so far recognized, of mineral-microorganism interactions in modern and ancient natural environments (see boxes in the poster).

This poster is intended to attract the attention of the geological community on this dissemination initiative and to look for:

amazing, high-definition microscope images of fossilized microorganisms as well as images of minerals, rocks or outcrops with high "geomicrobiological" potential.

If you agree to jump on the GEOMICROBI project providing some "microbial"-material, we are happy to offer:

- an acknowledgement to the Authors that will provide images or samples when this material will be used for activities of the project;
- the opportunity to host temporarily the photographic exhibition in your Institution;
- a printed copy of the photographic exposition containing a catalogue of microbial life hidden within minerals and rocks;
- a co-authorship for a publication about this initiative on a journal of science dissemination.

If you are interested or you want to receive more information regarding this initiative contact us by mail or filling the form using the QR code on the right.
