

EVALUATION OF CNES RLO5 BY AI AND PROSPECTS FOR A SIXTH RE-ITERATION

Jean-Michel Lemoine¹, Stéphane Bourgoigne², Sean Bruinsma¹, Thomas Vaujour³, Julia Pfeffer³, and Chloé Thenoz³

¹•CNRS, CNES DTN/CD/GS, Toulouse Cedex 9, France (jean-michel.lemoine@cnes.fr)

²•Stellar Space Studies, 5 Esp. Compans Caffarelli, 31000 Toulouse, France

³•Magellium, 1 Rue Ariane, 31520 Ramonville-Saint-Agne, France

GSTM2024 - POTSDAM

OCTOBER 8, 2024

SUMMARY

01 STATUS of the CURRENT CNES/GRGS RL05 release

02 STATUS of RL05 MEAN FIELD for POD

03 ARTIFICIAL INTELLIGENCE to HELP ASSESS the QUALITY of EACH MONTHLY SOLUTION

04 PROSPECTS for a 6th REITERATION

STATUS OF THE CURRENT CNES/GRGS RL05 RELEASE

01

- CNES/GRGS current time series, RL05, is available from April 2002 to May 2024
- Monthly and 10-day solutions up to degree 90
- Nominal inversion process is “Truncated SVD”
- But we also provide the monthly unconstrained solutions
- It is based on GRACE/GRACE-FO + geodetic SLR data (6 satellites)
 - Data weighting:
 - ▶ GPS ranges = 1 m
 - ▶ GPS undifferenced phases = 2 cm
 - ▶ KBRR = 0.1 micrometer/s
 - ▶ SLR data (SLR satellites only) = 1 cm
 - Parameterization:
 - ▶ KBRR bias + drift every half revolution
 - ▶ ACC bias + drift every half revolution
 - ▶ 1 ACC scale per day in X, Y, Z

STATUS OF RL05 MEAN FIELD FOR POD

02

- Current Mean Field is “CNES_GRGS.RL05MF_combined_GRACE_SLR_DORIS”
- It is based on
 - SLR + DORIS data from 1993 to 2002 (“super-mascons”)
 - GRACE/GRACE-FO + SLR data from 2002 to October 2022
 - on extrapolation after October 2022
- It contains a solution for degree 1, which becomes obsolete with ITRF2020
- It will soon be updated with fresher GRACE-FO data → “CNES_GRGS.RL05MF_u202405”
- **Good performances in POD of altimetric satellites** (cf. Sergei Rudenko’s presentation at the OSTST 2024 POD session)
- **Movie of the SLR + DORIS Time Variable Gravity solution before 2002...**

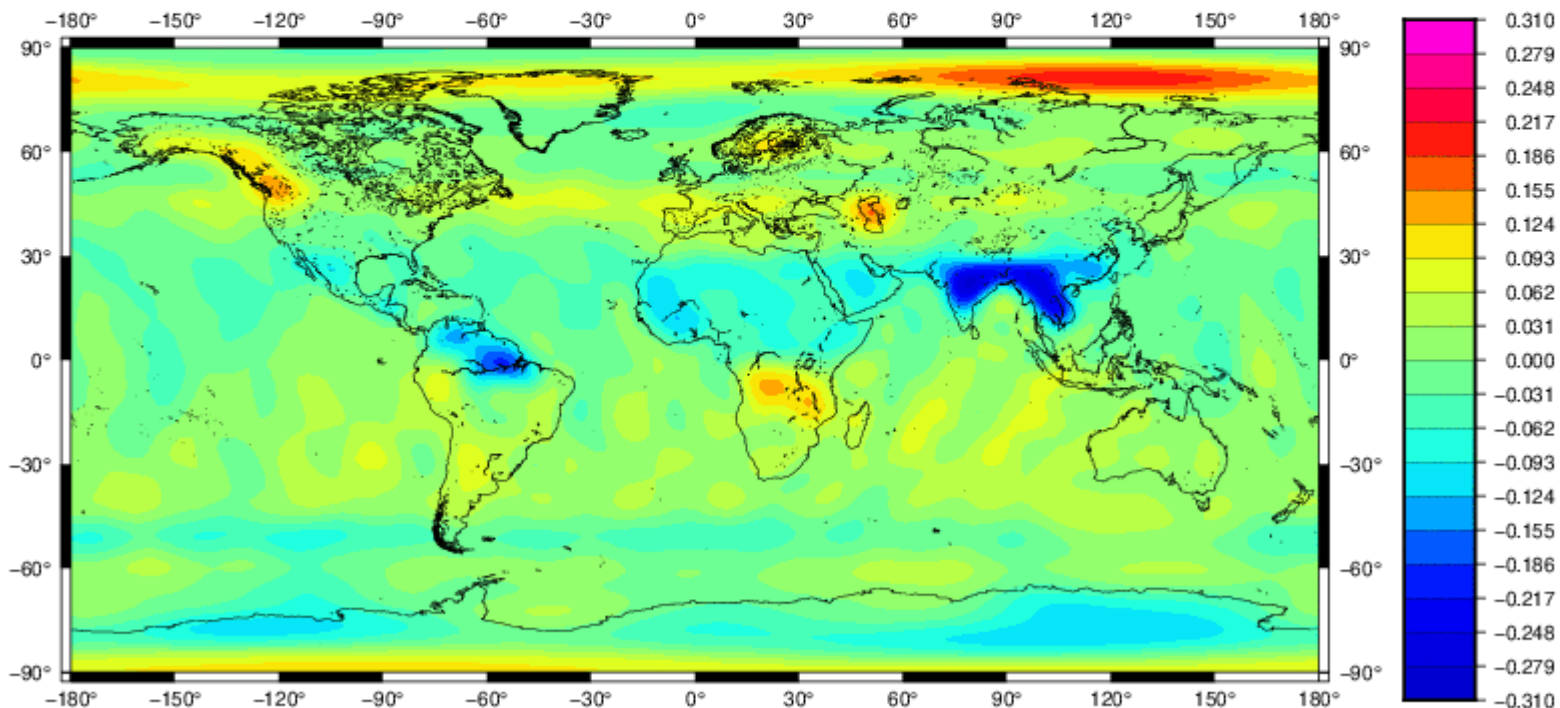

MOVIE OF THE SLR + DORIS TVG SOLUTION 1993 - 2002

02

Equivalent Water Height anomaly (m)

1993 - 01

(mean: -0.0000 / st.dev: 0.0448 / min: -0.2883 / max: 0.2077)

ASSESSMENT OF MONTHLY TVG SOLUTION QUALITY WITH AI

03

- Quality of the TVG solutions: usual metrics = RMS over the ocean, or over “quiet areas”
- We wanted to have a more in-depth view of error content of our solutions
- We asked the company Magellium to develop an analysis software of the TVG solutions by Artificial Intelligence

CNES L2 SVD: June 2011

CNES L2 SVD: January 2020

ASSESSMENT OF MONTHLY TVG SOLUTION QUALITY WITH AI

03

PROCESS

1- Create a mask

Exclude the zones where the hydrological signal is too strong

2- Choose a learning area (red mask)

(red mask)

3- Hand labeling of "candidate" noise pixels

20 years (2002-2022)
240 TVG solutions
Exclude 5 months for validation purposes

4- Train the Machine Learning algorithms over the learning area

2 algorithms have been tested:

- Random Forest (RF)
- Convolutional Neural Network (CNN)

5- Once trained, generalize the detection of the noise pixels to the full globe

6- Compare the performance of the algorithms

Over the 5 months that have been entirely hand-labelled

7- Use the chosen algorithm to produce a new metric of the solutions quality

And apply it to the 20 years of data

ASSESSMENT OF MONTHLY TVG SOLUTION QUALITY WITH AI

- The outcome of the Machine Learning process is, for each pixel, a **probability** that it is noise rather than signal

RF algorithm
Minimal probability = 0.2

Date: 2004-05
Detected noise pixels appear in white

RF algorithm
Minimal probability = 0.8

ASSESSMENT OF MONTHLY TVG SOLUTION QUALITY WITH AI

- For the same minimal probability, the 2 algorithms (RF and CNN) give different results

RF algorithm
Minimal probability = **0.5**

Date: 2011-05
Detected noise pixels appear in white

CNN algorithm
Minimal probability = **0.5**

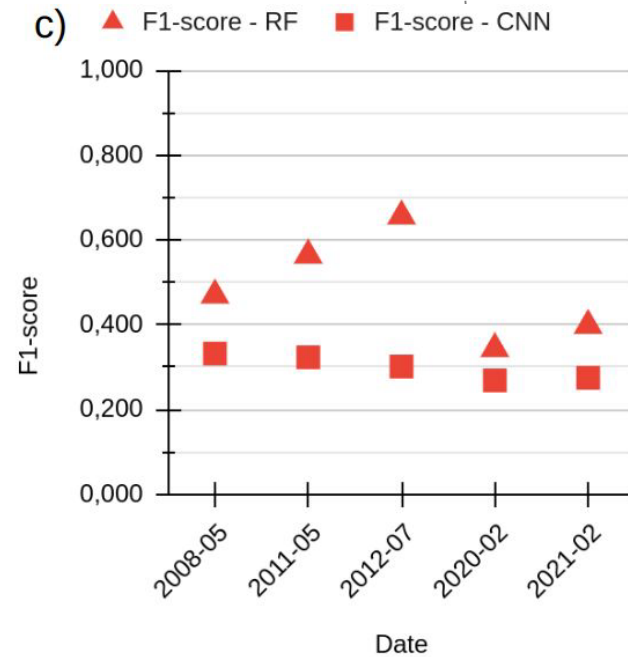

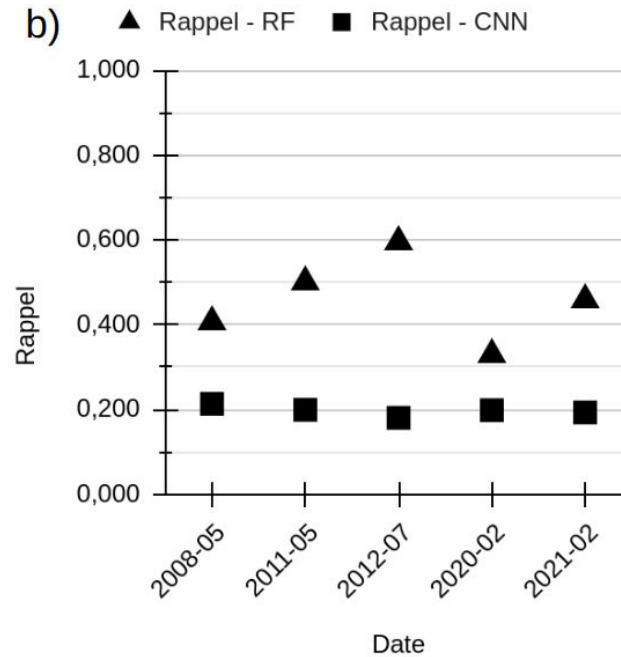

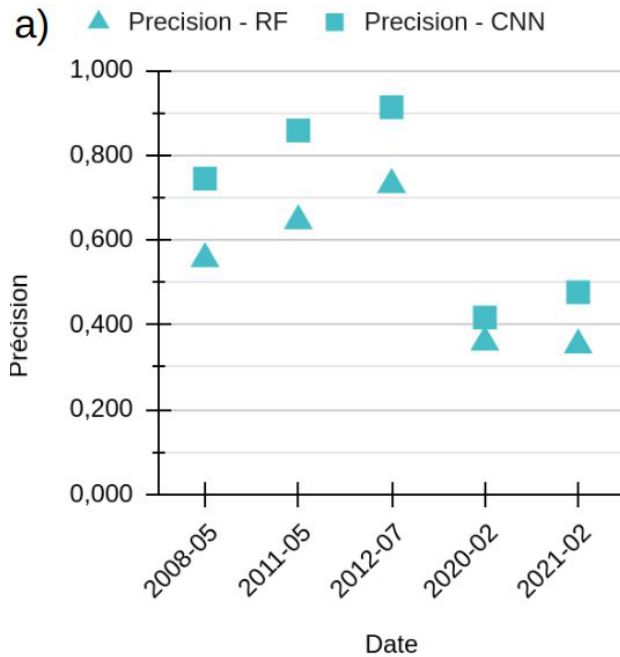

ASSESSMENT OF MONTHLY TVG SOLUTION QUALITY WITH AI

Performance of the 2 algorithms (RF & CNN)

Black dots = noise pixels
White circles = signal pixels

- **Precision** = Are the pixels I have detected as noise really noise ?
- **Recall** = Have I detected all the noise pixels there are?
- The comparison is done here for a minimal probability = 0.5

How many selected items are relevant?

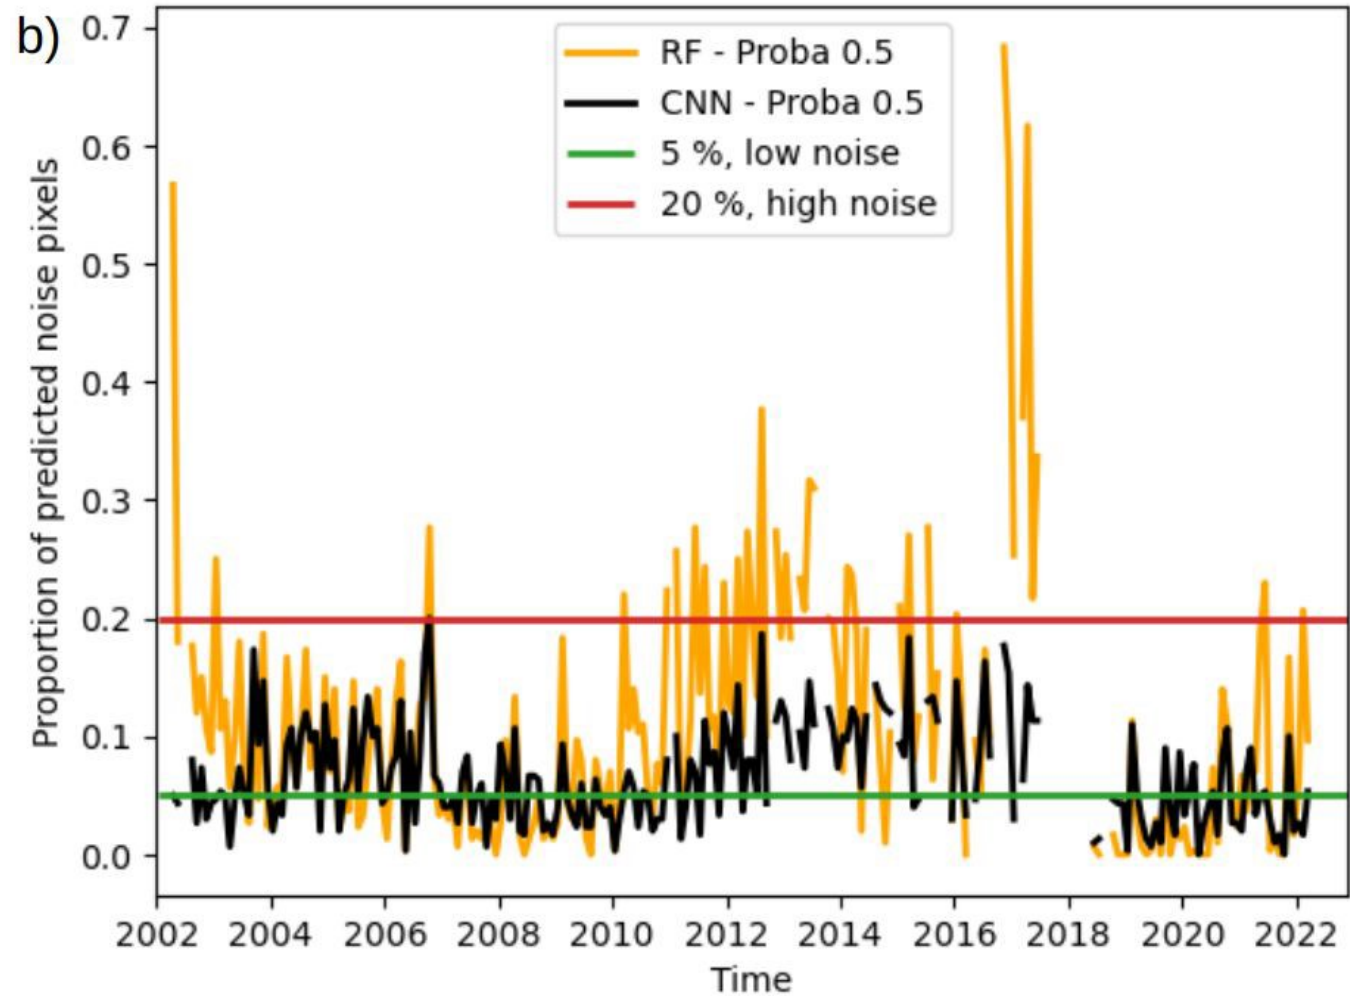

How many relevant items are selected?

ASSESSMENT OF MONTHLY TVG SOLUTION QUALITY WITH AI

03

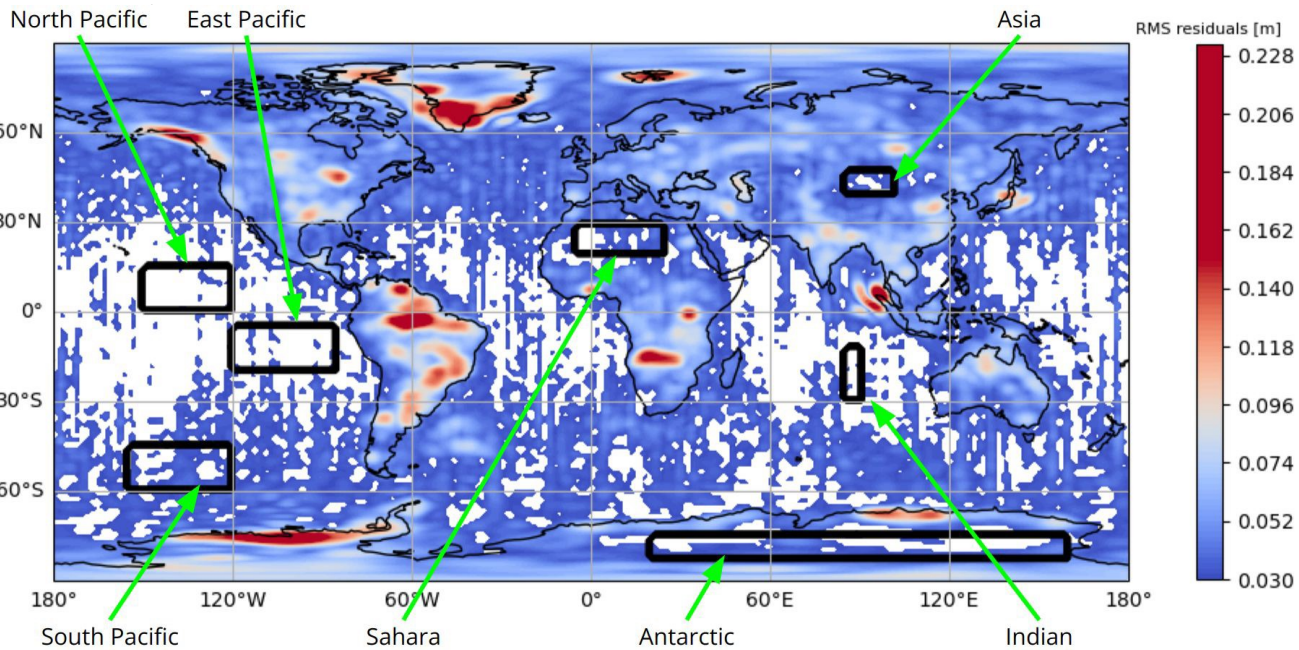

**Results for
20 years of
CNES/GRGS
RL05
solutions**

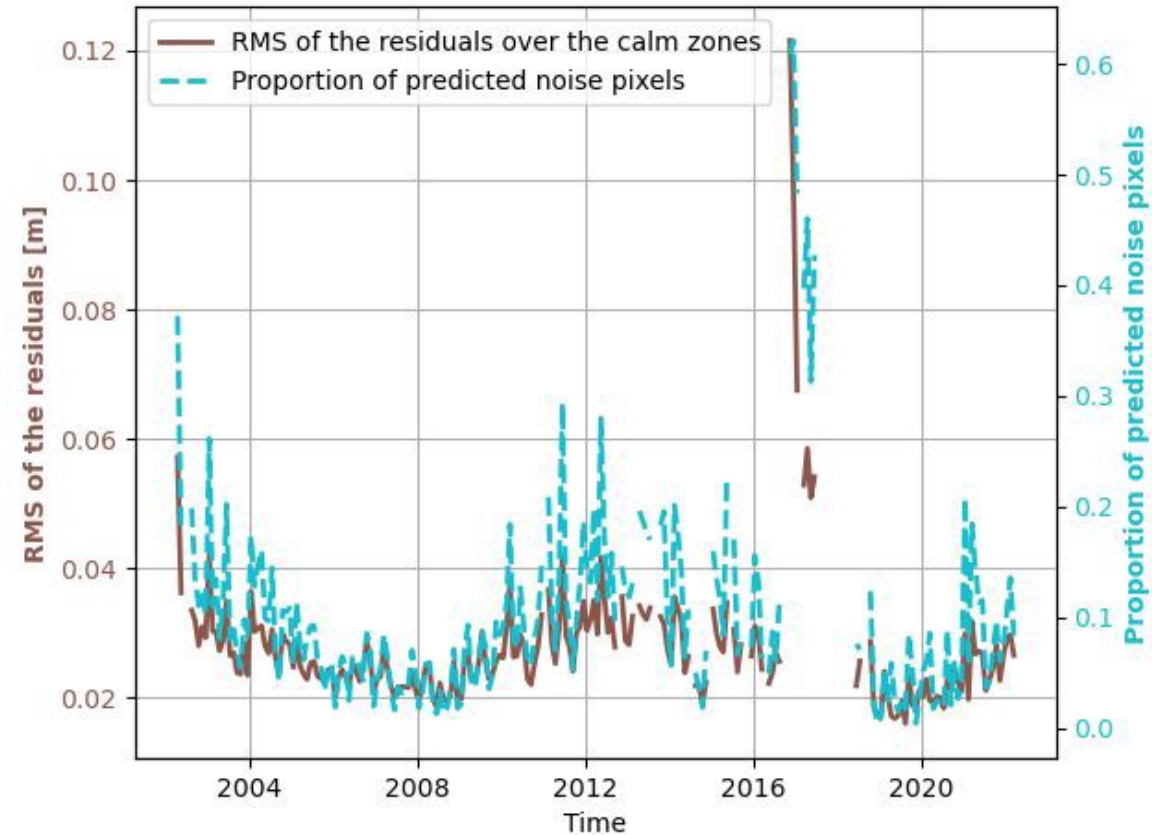

ASSESSMENT OF MONTHLY TVG SOLUTION QUALITY WITH AI

03

Comparison with the « RMS » metric over calm zones

Correlation coefficient between the two metrics: 0.88

ASSESSMENT OF MONTHLY TVG SOLUTION QUALITY WITH AI

AI analysis is not a simple statistic, but provides a probability map that each pixel is an error, which then allows adaptive filtering

Proba map predicted by the RF
Date: 2012-07

PROSPECTS FOR A 6TH REITERATION

04

- Availability of the new FES2022 model and the corresponding TUGO ocean dealiasing model from the LEGOS/CLS team
- Introduction in our computations of the variances-covariance matrices of both the instruments (KBR, ACC) and the dealiasing models
- Processing the GPS measurements in fixed ambiguity mode
- Completely redefining the parameterization of the ACC and KBR measurements:
 - ➔ Improved determination of C20 with GRACE-only
 - ➔ See poster P13 (GSTM2024-88) by Maya Nocet-Binois
